Content

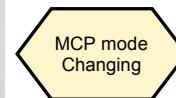

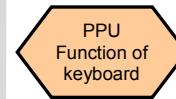

Unit Description

This unit describes the 808D ADVANCED PPU and MCP functionality, the coordinate system of a milling machine and how to enter passwords to access the system.

Unit Content

Basic Theory

The 808D machine control panel (MCP) is used to select the machine operating mode : JOG - MDA - AUTO

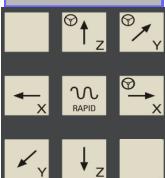

Preparation

MCP Moving axis

The 808D machine control panel (MCP) is used to control manual operation of the axis. The machine can be moved with the appropriate keys.

Axis remove

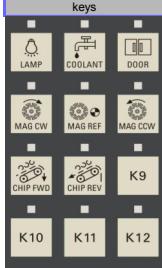

MCP OEM keys

The 808D machine control panel (MCP) is used to control OEM machine functions. The machine functions can be activated with the appropriate keys.

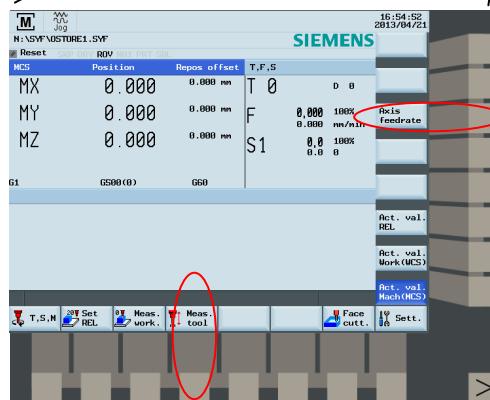

OEM keys

User interface

808D ADVANCED (PPU) has eight vertical softkeys (abbr. SKs) on the right of the screen. These SKs can be activated with the corresponding button (located on the right).

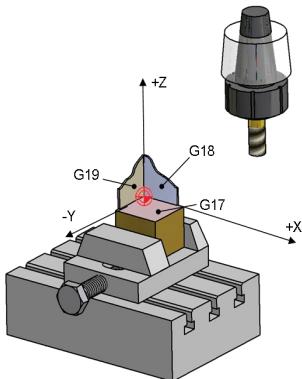

808D ADVANCED (PPU) has eight horizontal SKs on the bottom of the screen. These SKs can be activated with the corresponding button (located below).

Preparation

SIEMENS

SEQUENCE

Machine coordinate system

The Sinumerik 808D ADVANCED uses a coordinate system which is derived from the DIN 66217 standard. The system is an international standard and ensures compatibility between machines and coordinate programming. The primary function of the coordinate system is to ensure that the tool length and tool radius are calculated correctly in the respective axis.

Passwords

Passwords at the control are used to set the user's right to access the system. Tasks such as "Basic Operating", "Advanced Operating" and commissioning functions all depend on the passwords.

No password
Customer's password
Manufacturer's password

Machine operator
Advanced operator
OEM engineer

Changing password

Step 1

Customer's password
Manufacturer's password

= CUSTOMER
= SUNRISE

Usually the machine, operator does not need to change the password.

The service mode is opened with the appropriate key combination.

In the service mode, the password can be activated and deactivated.

Step 2

Set password

Change password

Delete password

Enter customer's or manufacturer's password

Change customer's or manufacturer's password

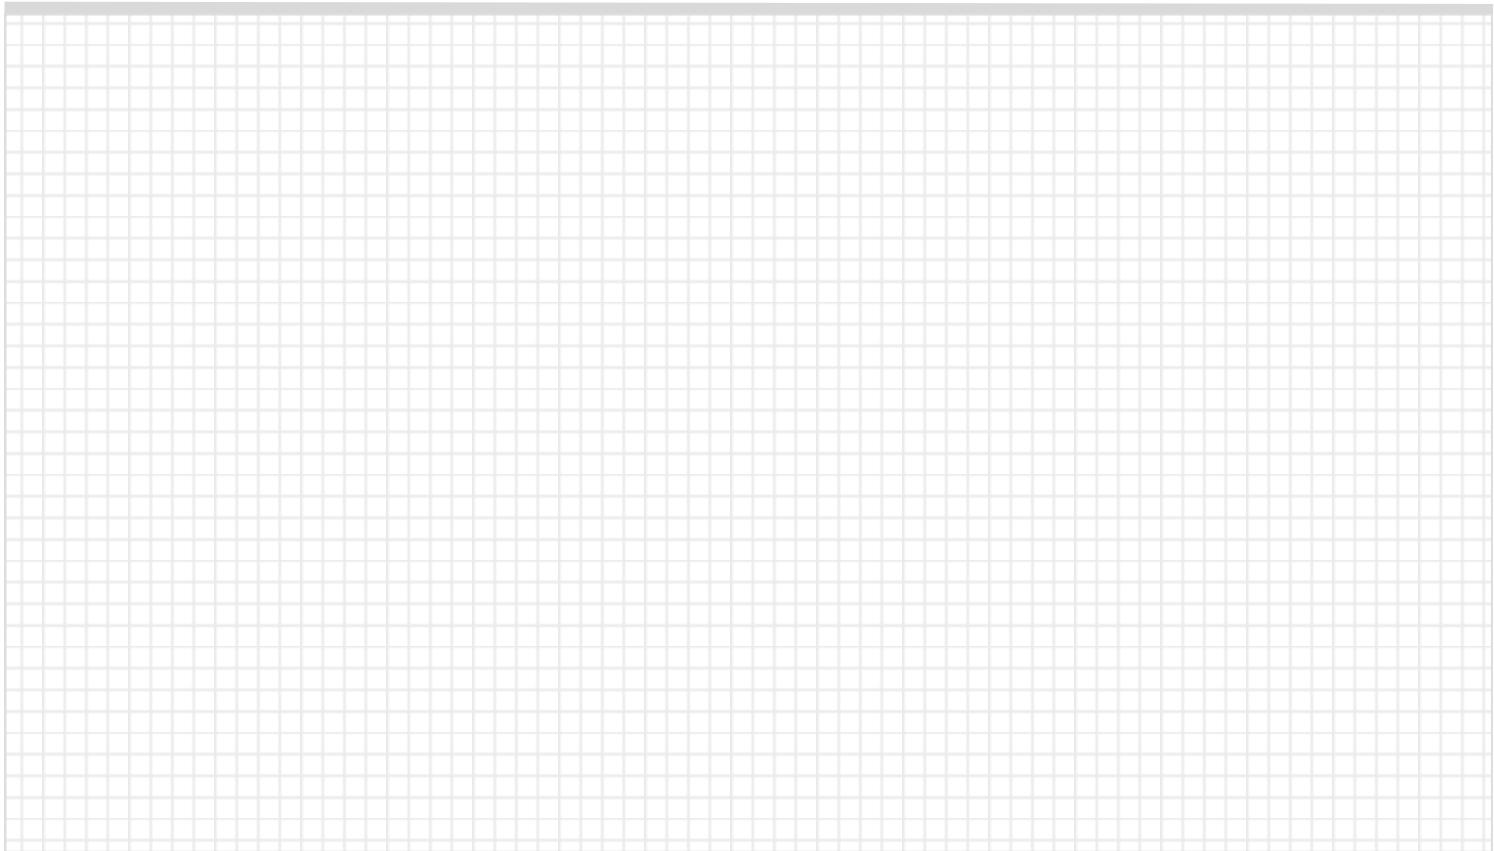

Delete customer's or manufacturer's password

End

Notes

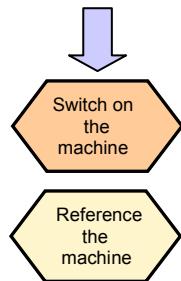

Switch On and Referencing

Content

Unit Description

This module describes how to switch the machine on and reference it.

Unit Content

SEQUENCE

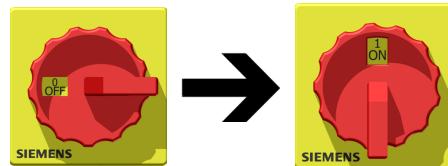

Switch on the machine

Please note the explicit switching on rules as specified by the machine manufacturer.

Step 1

Turn on the main switch of the machine.

The main switch is usually at the rear of the machine.

Step 2

Make sure you perform the following operation!

Release all the EMERGENCY STOP buttons on the machine!

End

Switch On and Referencing

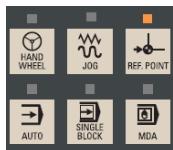

SEQUENCE

Reference
the
machine

If your machine is configured with ABS encoder, you do not need to reference the axis of the machine.
If your machine is fitted with INC encoder, After power on, the machine must first be referenced!

Step 1

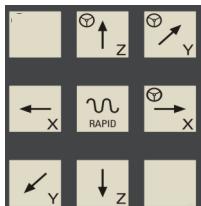

After power on, the machine will be in the reference point approach mode (default).

M Ref Point		
N : NSYF\NSTORE1.SYF		
MCS	Reference point	
MX○	0.000	mm
MY○	0.000	mm
MZ○	0.000	mm

If the axis is not referenced, the non-referenced symbol (circle) is displayed between the axis identifier and the value.

Step 2

The axes are referenced with the corresponding axis traversing keys.

The traversing direction and keys are specified by the machine manufacturer.

M Ref Point		
N : NSYF\NSTORE1.SYF		
MCS	Reference point	
MX○	0.000	mm
MY○	0.000	mm
MZ○	0.000	mm

After completing the referencing procedure for all axes, the referenced symbol is displayed next to the axis identifier.

Step 3

M JOG		
N : NSYF\NSTORE1.SYF		
MCS	Position	Repos offset
MX	0.000	0.000 mm
MY	0.000	0.000 mm
MZ	0.000	0.000 mm

After returning to JOG mode, use the axis traversing keys to move the machine manually.

The machine can now be operated in JOG mode.

During normal operation (JOG), the referenced symbol is not shown on the screen.

End

Notes

A large rectangular area filled with a uniform grid of light gray lines, creating a pattern of small squares. This grid covers most of the page below the 'Notes' header, intended for users to write their own notes.

Notes

A large rectangular area filled with a uniform grid of light gray lines, creating a pattern of small squares across the entire surface. This grid is intended for users to write their notes or draw diagrams.

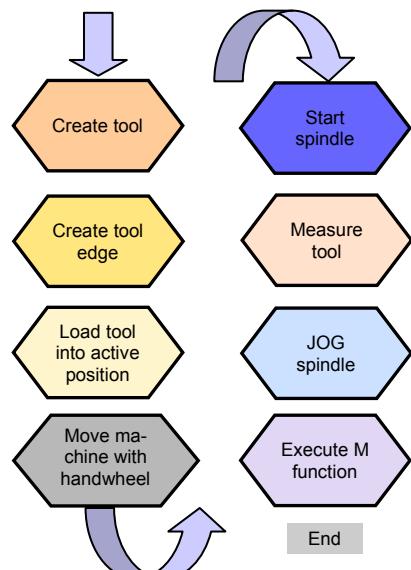

Content

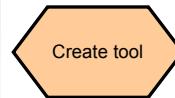

Unit Description

This unit describes how to create and set up tools.

Unit Content

SEQUENCE

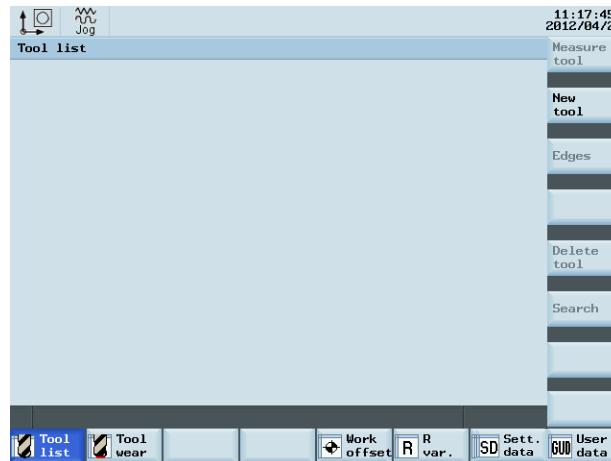

A tool must have been created and measured before executing the program.

Step 1 Please make sure the system is in JOG mode.

Press "Offset" on the PPU.

Press the "Tool list" SK on the PPU.

SEQUENCE

Step 2

The range of tool numbers which can be created by this system is 1 ~32000.
The machine can be loaded with a maximum of 64 tools / 128 tool edges.

Press the "New tool" SK on the PPU.

Select the type of tool required.

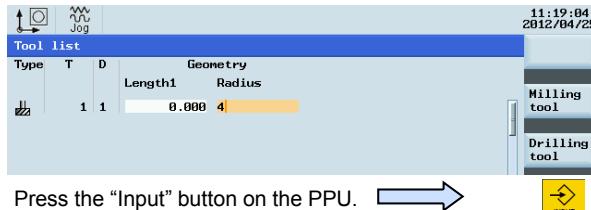

Enter "1" at "Tool No."

Press the "OK" SK on the PPU.

Enter the "Radius" of the milling tool.

Press the "Input" button on the PPU.

A tool must have been created and selected before creating a tool edge!

Step 1 Use "D" code to specify the tool edge. The system activates tool edge no. 1 per default at the start.

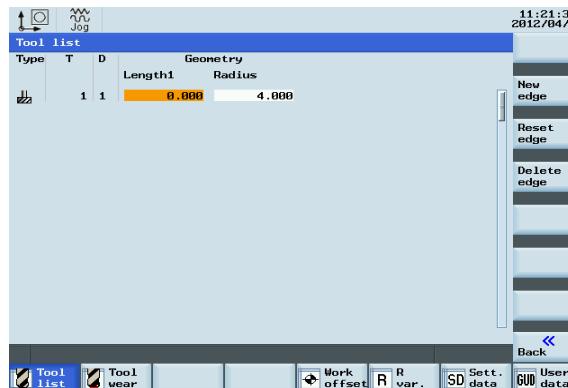

Press the "Offset" key on the PPU.

Press the "Tool list" SK on the PPU.

Use direction keys to select the tool which needs to add a tool edge.

Press the "Edges" SK on the PPU.

Press the "New edge" SK on the PPU.

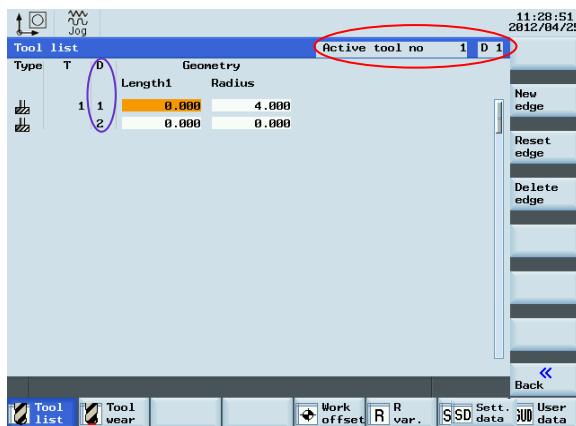

Tool Setup

SEQUENCE

Step 2

A new tool edge can be added in this way and different lengths and radii can be entered as required.

The red circle shows the actual active tool and tool edge, the purple circle shows how many tool edges have been created and the related data for each tool edge.

A maximum of nine tool edges can be created for each tool!
Different tool lengths and radii can be saved in different tool edges as required.
Please select the right tool edge for machining according to requirement!

A tool must have been created in the system before it can be loaded into the active position.

Press the "Machine" key on the PPU

Press the "JOG" key on the MCP

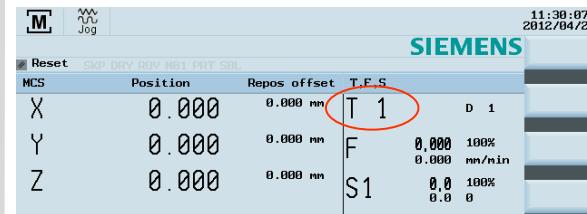

Press the "T.S.M" SK on the PPU

Enter tool number "1" in "T"

Press "CYCLE START" on the MCP

Press the "Back" SK on the PPU

Tool Setup

SEQUENCE

The tool are usually loaded manually into the spindle.

The tool will be automatically loaded into the spindle with an automatic tool changer.

Make sure there is no obstruction when moving the tool to avoid a crash.

A handwheel can control the axis motion instead of the "JOG" button.

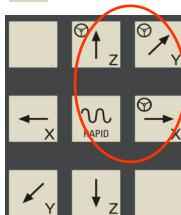

Press the "Machine" key on the PPU

Press the "Handwheel" key on the MCP

Select the axis you want to move with the appropriate keys. on the MCP

WCS	Position	Repos offset
X	0.000	0.000 mm
Y	0.000	0.000 mm
Z	0.000	0.000 mm

Under "WCS" or "MCS" state, a handwheel will be shown beside the axis symbols, showing the axis is chosen, and can be controlled with a handwheel.

SIEMENS

Select the required override increment according to the buttons on the right
(this selection fits all axes)

The handwheel increment is "0.001 mm"

The handwheel increment is "0.010 mm"

The handwheel increment is "0.100 mm"

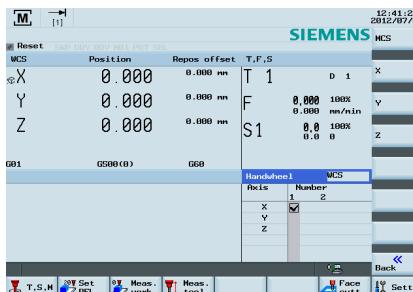

The selected axis can now be moved with the handwheel.

Press "JOG" on MCP to end the function of "Handwheel".

Notes: If set the MD14512[16]=80, the system will deactivate the function of MCP for selecting the axis of handwheel, the user will have to activate "Handwheel" function with PPU softkey.

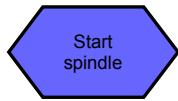

Select the required axis on the right of the PPU; the selected axis is shown with a ✓

Tool Setup

SEQUENCE

A tool must have been loaded and rotated to the position.

Start the spindle before adjusting tools as follows:

Press the "Machine" key on the PPU

Press the "JOG" key on the MCP

Press the "T.S.M" SK on the PPU

Enter "500" at "Spindle speed"

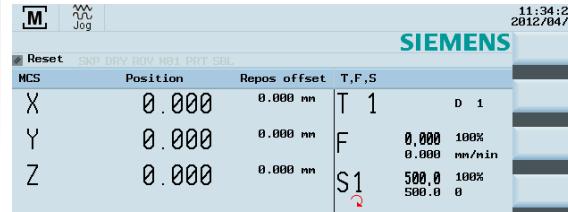

Select "M3" using the "Select" key on the PPU

Press the "CYCLE START" key on the MCP

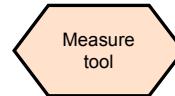

SIEMENS

Press "Reset" on the MCP to stop the spindle rotation

Press the "Back" SK on the PPU

A tool must have been created and loaded before it can be measured!

Step 1 Measure length

Press the "Machine" key on the PPU

Press the "JOG" key on the MCP

Press the "Meas. tool" SK on the PPU

Press the "Measure manual" SK on the PPU

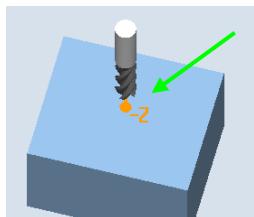

Tool Setup

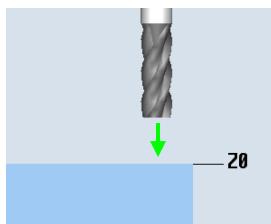

SEQUENCE

Press the axis keys on the MCP to move the tool to the set position above the workpiece.

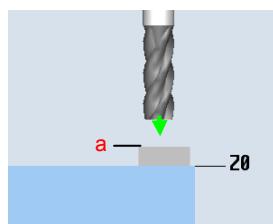

Note: The following text describes the required settings in the workpiece coordinate system
"X / Y / Z" zero points as: "X0" / "Y0" / "Z0"

Press the "Handwheel" key on the MPC and position the tool at location Z0 or a of the workpiece.

or

Move directly to zero point

Use "SELECT" key to set the reference point as "workpiece" (In real measurement, the reference point can be set as either "workpiece" or "fixed point" if required.)

Enter "0" for "Z0"
 (If the setting block is used, then the value would be thickness a)

Press the "Set length" SK on the PPU

The measured tool length is now shown in "Length (L)". This value is also saved in the length value column of the corresponding tool list at the same time.

Step2 Measure diameter

Press the "Diameter" SK on the PPU

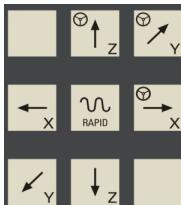

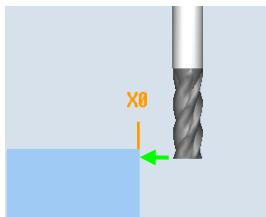

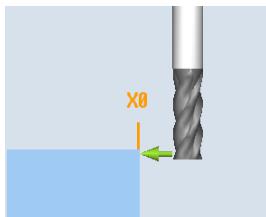

Tool Setup

SEQUENCE

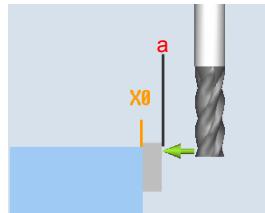

Press the axis keys on the MCP to move the tool to the set position.

Press the "Handwheel" key on the MCP and position the tool at the location X0 or *a* of the workpiece.

or

Move directly to zero point

Use a setting block.

Enter "0" at "X0"

Enter "0" at "Y0"

(This is the value of the width of a setting block if it is used. Select one of X0/Y0 according to requirement.)

Press the "Set diameter" SK on the PPU

Press the "Back" SK on the PPU

Tool Setup

SEQUENCE

A tool must be loaded to the spindle.

Press the “Machine” key on the PPU.

Press the “JOG” key on the MCP.

Press the spindle direction key on the MCP to start/stop the spindle.

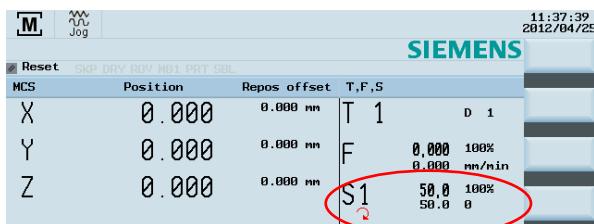

Press “Spindle left” on the MCP to start the spindle in the counter-clockwise direction.

Press “Spindle stop” on the MCP to stop the spindle.

Press “Spindle right” on the MCP to start the spindle in the clockwise direction.

Please make sure all the machine axes are in safe positions before executing the M function!

Press the “Machine” key on the PPU.

Press the “T.S.M” SK on the PPU.

Use the direction key to move the highlighted cursor to “Other M function” and enter “8”. This will start the coolant.

Press “CYCLE START” on the MCP.

The coolant function button on MCP is active.

Press the “Reset” key on the MCP to stop the coolant function.

Press the “Back” SK on the PPU.

Notes

Notes

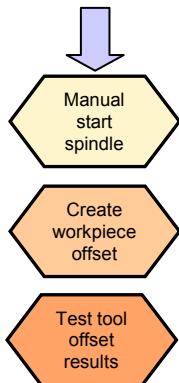

Workpiece Setup

Content

Unit Description

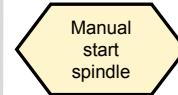

This unit describes how to set the workpiece offset and test the tool results.

Unit Content

SIEMENS

SEQUENCE

A tool must have been loaded into the spindle.

Before measuring, the spindle can be started as follows:

Press the "Machine" key on the PPU.

Press the "JOG" key on the MCP.

Press the "T.S.M" SK on the PPU.

Enter "500" in "Spindle speed" on the PPU.

Select "M3" as the "Spindle direction" using the "Select" key on the PPU.

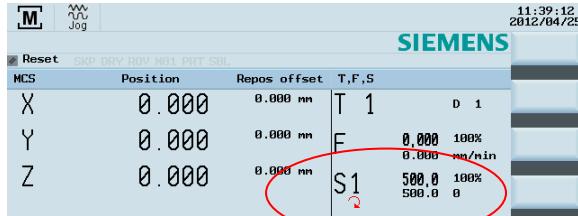

Press "CYCLE START" on the MCP.

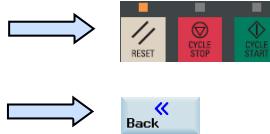

SEQUENCE

Press the "Reset" key on the MCP to stop the spindle rotation.

Press the "Back" SK on the PPU.

A tool must have been created and measured before it can be used to set the workpiece offset.

Make sure the active tool is the measured tool!

Press the "Machine" key on the PPU.

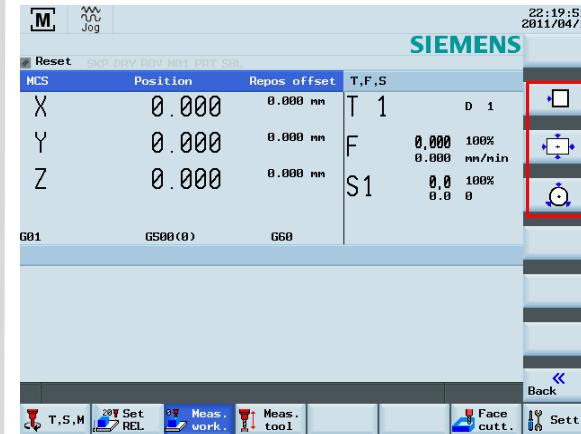

Press the "JOG" key on the MCP.

Press the "Meas. work." SK on the PPU.

As the following red frame shows, 808D ADVANCED provides the user with three methods of using tools to simplify the operating process.

SEQUENCE

Method1 This method is normally for setting the zero point of the workpiece at the edge of the workpiece.

Using a tool that has a measured “Tool length & radius”, move the tool to a known position on the workpiece. Using either JOG or Handwheel, scratch an edge and then calculate the zero point of the workpiece.

The process of setting the “X” zero point (“X0”) is described below.

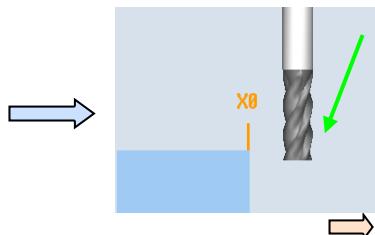

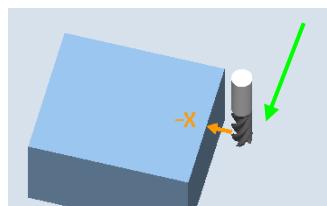

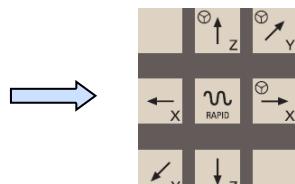

Press the corresponding SK of the first icon on the right-hand side of the PPU.

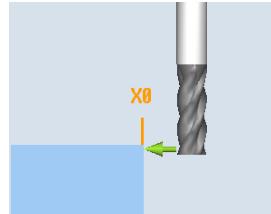

Press the appropriate SK to select the feed axis which needs to be set up.

Press the axis traverse keys to move the tool to the required setting position in the X axis.

Press the “Handwheel” key on the MCP to position the tool at the X0 edge of the workpiece.

Select “Save in” Offset “G54” (or other offset).

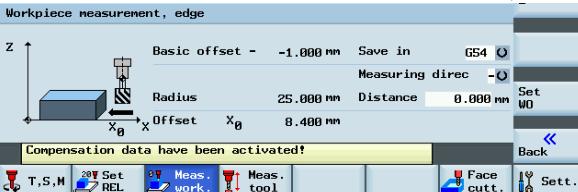

Select “Measuring direction” as “-”.
(This value should be chosen according to realities)

Set “Distance” as “0”.

Press the “Set WO” SK on the PPU.

“Step 2” must be repeated for the setting of Y and Z zero points.
If you change the tool because of wear/damage during the machining process, you must remeasure the length of the tool.

SEQUENCE

Method 2 This method is normally used for setting the workpiece zero point at the center point of a rectangular workpiece.

Using tools with a measured “length and radius”, move them to the four edges of the rectangular workpiece. Using either JOG or Handwheel, scratch an edge and then calculate the zero point of the workpiece.

Press the corresponding SK of the second icon on the right-hand side of the PPU.

Observing the figure on the PPU, move the coordinate axis following the orange arrow to move the tool to the specified position and scratch the edge of the workpiece.

Press the “Save P1” SK on the PPU to save the coordinate axis of the 1st position in the system.

Repeat the process for positions 2, 3 and 4.
(When the setting is complete, the buttons will be shown in blue.)

Press the “Set WO” SK on the PPU.

You have then finished setting the zero point of the workpiece as the center point of the rectangular workpiece.

Method 3 This method is normally used for setting the zero points at the center point of a circular workpiece.

Using tools with a measured “length and radius”, move them to the three edges of the circular workpiece. Using either JOG or Handwheel, scratch an edge and then calculate the zero point of the workpiece.

Press the corresponding SK of the third icon on the right-hand side of the PPU.

Observing the figure on the PPU, move the coordinate axis following the orange arrow to move the tool to the specified position and scratch the edge of the workpiece.

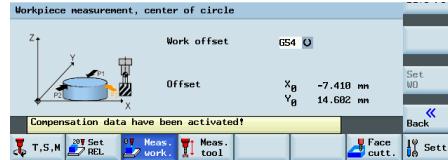

Press the “Save P1” SK on the PPU to save the coordinate axis of the 1st position in the system.

Repeat the process for positions 2 and 3.
(When the setting is complete, the buttons will be shown in blue.)

Press the “Set WO” SK on the PPU.

You have then finished setting the zero point of the workpiece as the center point of the circular workpiece.

Workpiece Setup

SIEMENS

SEQUENCE

The tool setup and workpiece setup must have been performed correctly so that it can be tested as follows!

In order to ensure the machine safety and correctness, the results of the tool offset should be tested appropriately.

Press the "Machine" key on the PPU.

Press the "MDA" key on the MCP.

Press the "Delete file" SK on the PPU.

Enter the test program recommended on the right. (can also be customized)

G54 (select offset panel as required)

T1 D1

G00 X0 Y0 Z5

Press the "ROV" key to ensure the "ROV" function is active (lit up).

Note: The ROV function activates the feedrate override switch under the G00 function.

Make sure the feedrate override on the MCP is at 0%!

Press "CYCLE START" on the MCP.

Increase the feedrate override gradually to avoid accidents caused by an axis moving too fast. Observe whether the axis moves to the set position.

Notes

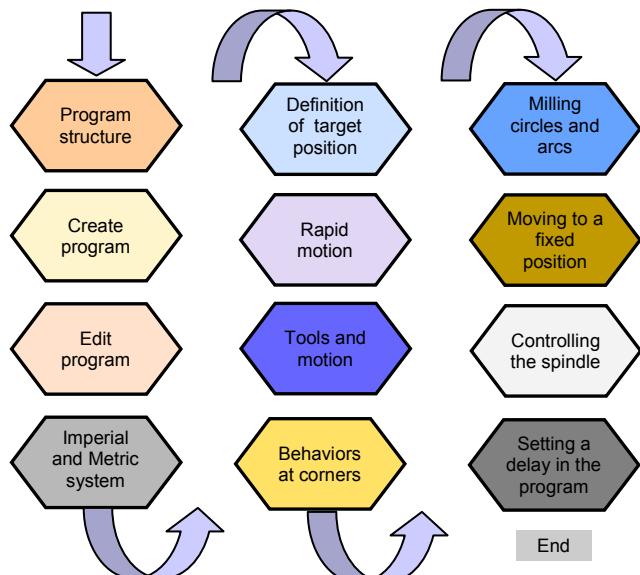

A large rectangular area filled with a uniform grid of light gray lines, creating a pattern of small squares. This grid covers most of the page below the 'Notes' header, intended for users to write their own notes.

Create Part Program Part 1

SEQUENCE

Create program

Step 1

Programs can be created with the “program manager”. You can select the “program manager” using the key located on the PPU.

Step 2

Select NC as the storage location for the program. Programs can only be created in the NC.

Step 3

Create a new program with the “New” SK on the right of the PPU.

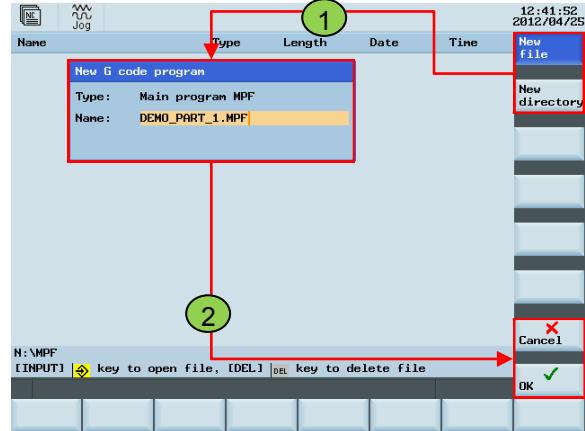

Step 4

You can choose “New” or “New directory”.

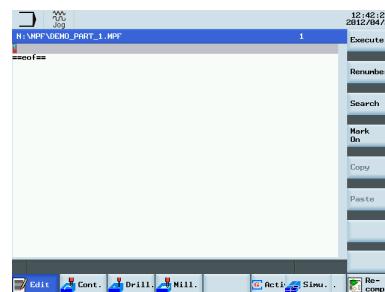

Choose “New” to create a program.

Choose “New directory” to create a file.

Step 5

Now the program is opened and can be edited.

The system will save it automatically after editing.

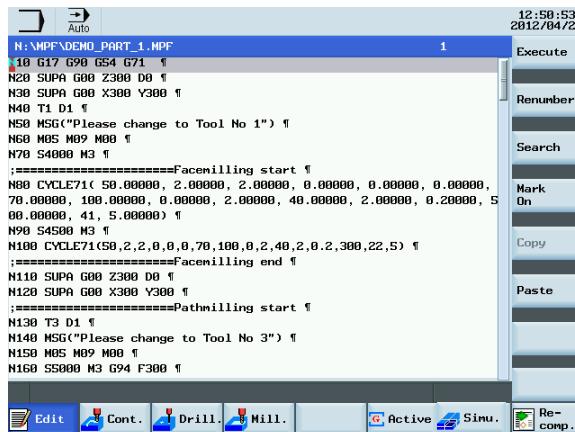

End

Create Part Program Part 1

Basic Theory

Edit program

The program shown in the editor can be created and edited with the appropriate keys.

Inches and mm

G71

With G71 at the header, the geometry data will be in the metric unit system, the feedrate in the default metric system.

N20 G00 X3.93 Y3.93 Z5

N25 G01 Z-0.787

N30 Z0.196

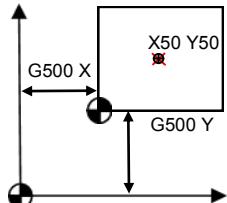

N35 G00 Z19.68 D0

Basic Theory

Definition of target position

G500

All absolute path data will be relative to this position. The position is written in the G500 (basic) zero offset.

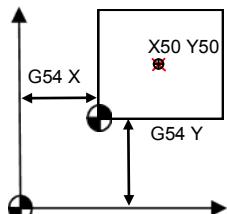

```
N5 G17 G90 G500 G71
N10 T1 D1 M6
N15 S5000 M3 G94 F300
N20 G00 X50 Y50 Z5
N25 G01 Z-20
N30 Z5
N35 G00 Z500 D0
```

Or

**G54 G55 G56 G57
G58 G59**

With G500 = 0, the offset for the work-piece can be stored in the G54 workpiece offset.

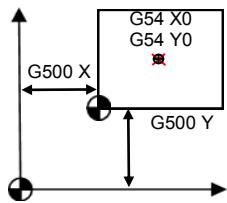

```
N5 G17 G90 G54 G71
N10 T1 D1 M6
N15 S5000 M3 G94 F300
N20 G00 X0 Y0 Z5
N25 G01 Z-20
N30 Z5
N35 G00 Z500 D0
```

Or

G500 + G54

With G500 unequal to 0 and be activated, the value in G500 will be added to the value in G54.

```
N5 G17 G90 G500 G71
N10 T1 D1 M6
N15 S5000 M3 G94 F300
N20 G00 G54 X20 Y20 Z5
N25 G01 Z-20
N30 Z5
N35 G00 G53 Z500 D0
```

G90

Absolute positioning; with G90 at the header, the geometry data which follows will be interpreted relative to the active zero point in the program, usually with G54 or G500 or G500 + G54.

N5 G17 G90 G54 G71

```
N10 T1 D1 M6
N15 S5000 M3 G94 F300
N20 G00 X100 Y100 Z5
N25 G01 Z-20
N30 Z5
N35 G00 Z500 D0
```

G91

Relative positioning; with G91 you can add an incremental value (G91-defined data is the relative positioning using the present position as the start point). Finally you should change the program to absolute positioning with G90.

N5 G17 G90 G54 G70

```
N10 T1 D1 M6
N15 S5000 M3 G94 F300
N20 G00 X3.93 Y3.93 Z0.196
N25 G01 G91 Z-0.787
N30 Z0.196
N35 G00 G90 Z19.68 D0
```

Create Part Program Part 1

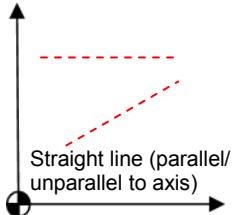

SIEMENS

Basic Theory

Rapid motion

G00

When G00 is activated in the program, the axis will traverse at the maximum axis speed in a straight line.

N5 G17 G90 G54 G71

N15 S5000 M3 G94 F300
N20 G00 X50 Y50 Z5
N25 G01 Z-5
N30 Z5
N35 G00 Z500 D0

- Feedrate
- Spindle speed
- Feed type
- Spindle direction

In the program, the feed rate is defined with "F". Two types of feed rate are available:

1. Feed per minute → G94
2. Feed per revolution of the spindle → G95

G94

Defines the feed rate in terms of time (unit: mm/min).

G95

Defines the feed rate in terms of spindle revolutions (unit: mm/rev).

S

The spindle speed is defined with "S"

S5000

M3/M4

The spindle direction is defined with M3 and M4, clockwise and counter-clockwise respectively.

G01

When G01 is activated in the program, the axis will traverse at the programmed feed rate in a straight line, according to the feed rate type defined by G94 or G95.

N5 G17 G90 G54 G71

N10 T1 D1 M6
N15 S5000 M3 G94 F300
N20 G00 X50 Y50 Z5
N25 G01 Z-5
N30 Z5
N35 G00 Z500 D0

N35 G00 Z500 D0

Tools and motion

T1 D1 M06

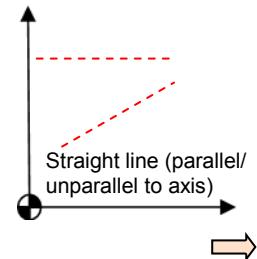

Using the "T" command, the new tool can be selected. The "D" command is used to activates the tool length offset.

M06 can be also used for machines with automatic tool changer.

N5 G17 G90 G54 G71

N10 T1 D1 M6
N15 S5000 M3 G94 F300
N20 G00 X50 Y50 Z5
N25 G01 Z-20
N30 Z5
N35 G00 Z500 D0

Basic Theory

Behavior at corners

Activation/
deactivation of the
tool radius com-
pensation when working
on the part contour.

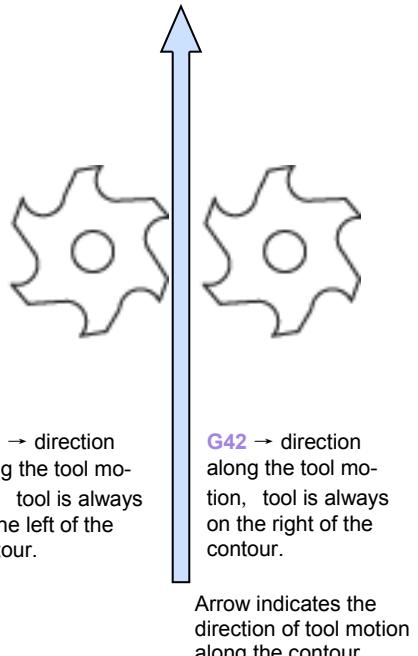

G41 / G42 and G40

With G41/G42,
the tool radius com-
pensation will be
done in the direction
of travel.

G41: Compensation
to left

G42: Compensation
to right

G40: Compensation
of the radius can be
deactivated

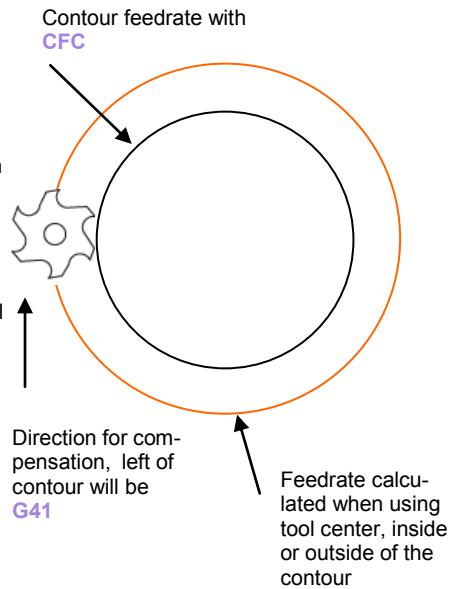

Arrow indicates the
direction of tool motion
along the contour.

When traversing circular
contours with cutter radius
compensation, it should be
decided whether the feed
rate should be calculated
along the contour of the
workpiece or along the path
defined by the center point
of the cutting tool.

When using a contour with
a feed rate defined by the
CFC code, the feed rate will
be constant at the contour,
but in some cases, it may
cause increases in the feed
rate of the tool.

This increase could dam-
age the tool if excessive
material is encountered at
the contour; this function is
normal for finish cutting of
contours.

The **CFTCP** command
ensures a constant feed
rate, however a constant
feed rate may not be en-
sured at the contour, which
may cause deviations in
surface finish.

The result of the two commands will
be such that the cutter goes very fast
around a corner or slow on the con-
tour.

Basic Theory

Milling circles and arcs

The circle radius shown in the example on the right can be produced with the specified part program code.

When milling circles and arcs, you must define the circle center point and the distance between the start point / end point and the center point on the relative coordinate.

When working in the XY coordinate system, the interpolation parameters I and J are available.

```
N5 G17 G90 G500 G71
N10 T1 D1 M6
N15 S5000 M3 G94 F300
N20 G00 X-20 Y-20 Z5
N25 G01 Z-5
N30 G41 X0 Y0
N35 Y50
N40 X100
N45 G02 X125 Y15 I-12 J-35
N50 G01 Y0
N55 X0
N60 G40 X-20 Y-20
N35 G00 Z500 D0
```

Note:

N45 can also be written as follows
N45 G02 X125 Y15 CR=37

Two common types of defining circles and arcs:

①: G02/G03 X_Y_I_J_;

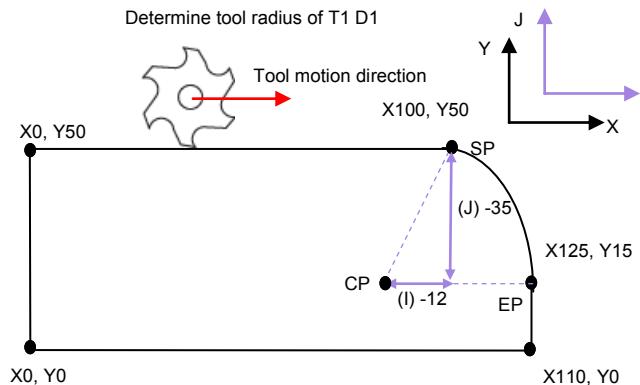

②: G02/G03 X_Y_CR=_;

Arcs $\leq 180^\circ$, CR is a positive number

Arcs $> 180^\circ$, CR is negative number

When milling circles, you can only use ① to define the program!

SP = start point of circle

CP = center point of circle

EP = end point of circle

I = defined relative increment from start point to center point in X

J = defined relative increment from start point to center point in Y

G2 = define circle direction in traversing direction = G2 clockwise

G3 = define circle direction in traversing direction = G3 counter-clockwise

Basic Theory

Moving to a
fixed
position

Using the code **G74**,
the machine can
move to the
reference point auto-
matically.

Controlling
the spindle

The following functions can be
used to influence the operation
of the spindle:

M3 accelerate to programmed
speed clockwise

M4 accelerate to programmed
speed counter-clockwise

M5 spindle decelerate to stop

M19 orient the spindle to a
specific angular position.

Setting a
delay in the
program

G04 can be used to pause the
tools' movements during op-
eration

G04 F5: Program pause of
5 s
This makes the surface of the
workpiece much smoother

Hole centering

The easiest way to center drill a hole prior to drilling is to use either CY-CLE81 or CY-CLE82.
CYCLE81: Without delay at current hole depth
CYCLE82: With delay at current hole depth

The relevant cycle can now be found using the vertical softkey on the right.

Deep hole drilling → **Deep hole drilling**

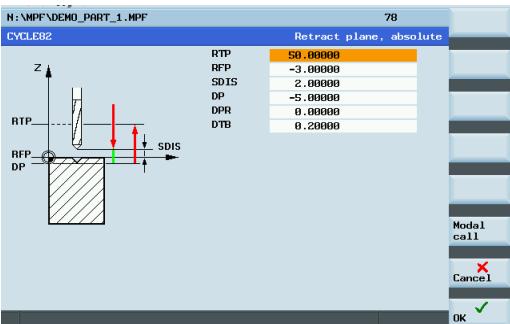

Select “Deep hole drilling” using the vertical SKs , and then select “Deep hole drilling”, and parameterize the cycle according to requirements.

Basic Theory

For descriptions of RTP, RFP, SDIS and DP, please see [page 40](#)

FDEP=5	Reach first drilling hole depth. Z axis coordinate is -5 (absolute coordinate value)	
FDPR=5	From the reference plane, drill downwards 5mm	
DAM=90	Decrement is 90	
DTB=0.7	Pause 0.7 s during final tapping of thread depth (discontinuous cutting)	DTB <0: Unit is r
DTS=0.5	Stops at the start position for 0.5 s (for VARI=1, removal active)	DTS <0: Unit is r
FRF=1 (range:0.001~1)	Original effective feed rate remains unchanged	Feed rate modulus
VARI=0	Interruption in drilling is active	VARI=1 retraction of active quill back to reference plane
AXN=3	AXN is tool axis, under appointed G17 use Z axis	The value of AXN decides which axis to use
MDEP=5	Minimal drilling depth 5 mm	This parameter activates only when DAM <0
VRT=1.4	Interruption in drilling, the retraction value of the quill is 1.4 mm	VRT=0 → retraction value is 1mm VRT>0 → retraction value is appointed value
DTD=0.6	Pauses at the position of final drilling depth for 0.6 s	DTD <0:unit is r, DTD =0:same as DTB
DIS1=1.6	When reinserting a quill, you can program a distance limit of 1.6 mm	For specific explanations please refer to the standard handbook

DAM parameter

①DAM≠0, the first drilling operation (FDPR) cannot exceed the drilling depth. As of the second drilling operation, the drilling is acquired from the last depth operation (drilling depth=last drilling depth-DAM). The calculated drilling must be >DAM. If the calculated drilling is ≤DAM, as of the next feed, the DAM value will be the feed depth until the end of the feed. If the last remaining depth is <DAM, then drilling is performed automatically until the required depth is reached.

②DAM=0, drilling depth each time is same as the 1st drilling depth (FDPR). In case the residual depth <2xFDPR, the last 2 cutting depth are half of the residual depth.

Example: 40 mm deep hole as an example, with DAM=2 mm and DAM=0 mm feed					
Feed times	Every feed depth/mm DAM=2	Actual depth/mm	Feed times	Every feed depth/mm DAM=0	Actual depth/mm
1.	FDPR=10	-10	1.	FDPR=10	-10
2.	FDPR-DAM=10-2=8	-18	2.	FDPR=10	-20
3.	(FDPR-DAM)-DAM =8-2=6	-24	3.	FDPR=10	-30
4.	(FDPR-2DAM)-DAM =6-2=4	-28	Remaining depth =10 < 2xFDPR, the remaining depth distribute by the last two drilling		
5.	(FDPR-3DAM)-DAM =4-2=2	-30	4.	5	-35
6.	DAM=2	-32	5.	5	-40
7.	DAM=2	-34	6.		
8.	DAM=2	-36	7.		
9.	DAM=2	-38	8.		
10.	DAM=2	-40	9.		

Create Part Program Part 2

⚠ The cycle is used together with the drilling fixed cycle to decrease the hole clearance

Create Part Program Part 2

Basic Theory

Contour milling with cycle

The easiest way to rough and finish around a contour is to use the contour milling function.

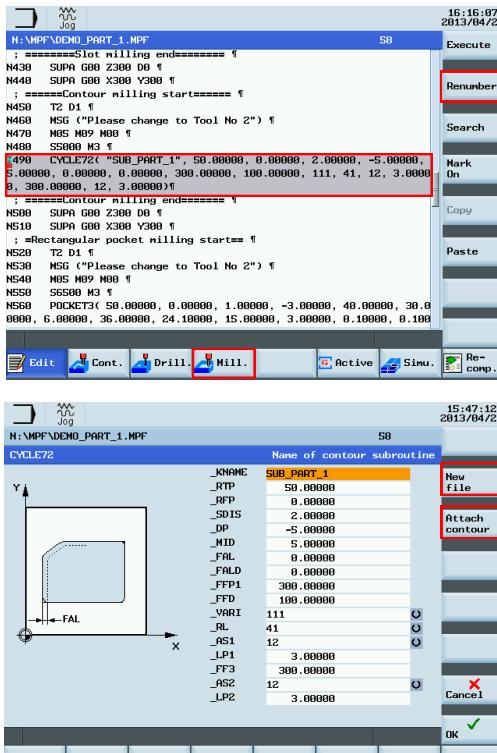

The cycle can be found and parameterized via the "Mill." SK.

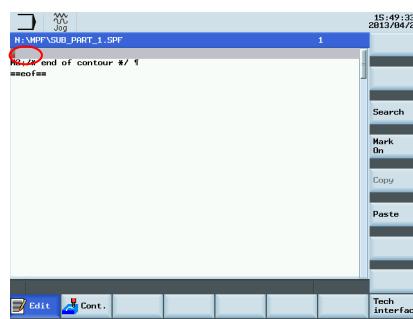

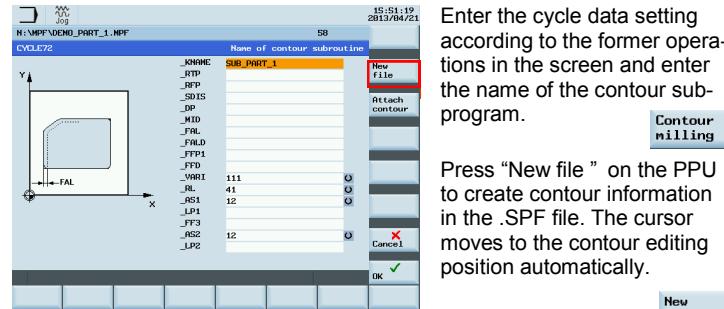

The "Contour milling" SK can be found in the vertical SKs on the right.

The parameterization is performed as in this figure.

By selecting the "New file" SK, the contour turning data can be inserted into Sub Program File (.SPF). You can edit and change it when selected. The sequence is as follows:

**Contour
milling**

Enter the cycle data setting according to the former operations in the screen and enter the name of the contour sub-program.

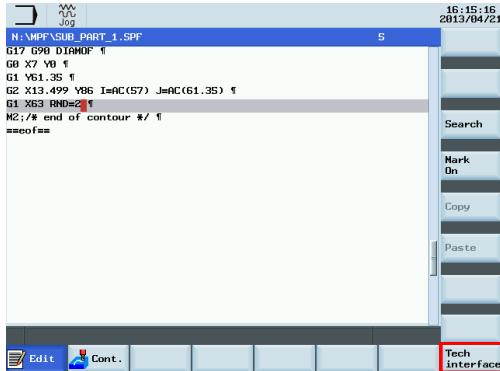

Press "New file" on the PPU to create contour information in the .SPF file. The cursor moves to the contour editing position automatically.

Create Part Program Part 2

SIEMENS

Basic Theory

After opening the contour data setting window, please make the following settings:

Enter appropriate coordinates based on the data from the technical drawing.

A screenshot of the Siemens PPU interface. The main window displays a G-code program titled 'H:\MPF\DEMO_PART_1.MPF'. The date and time are shown as '16:16:07 2013/04/21'. The code includes several G40 commands for contour milling and a G40 command for pocketing. The bottom toolbar has buttons for Edit, Cont., Drill., Mill., Active, Simu., and Re-comp.

INDA=90	Incremental angle, angle between the slots is 90°	INDA=0, cycle will calculate the incremental angle automatically
MID=3	Maximal depth of one feed is 3 mm	MID=0 → complete the cutting of the slot depth
CDIR=3	Milling direction G3 (in negative direction)	Evaluate value 2→use G2 (in positive direction)
FAL=0.2	Slot side, finishing allowance is 0.2 mm	
VARI=0	The type of machining is complete machining	VARI=1→roughing VARI=2→finishing
MIDF=5	Maximal feed depth of the finishing is 5 mm	
FFP2=250	Feed rate of finishing is 250 mm/min	
SSF=3000	Spindle speed for finishing is 3000 mm/min	
FFCP=	Feed rate at the center position on the circle path , unit is mm/min	
If FFP2/SSF are not specified, then use the feed rate/spindle speed of rotation as default		
Before recalling the cycle, you must set the tool radius compensation value.

Unit Description

This unit describes how to load the program in “AUTO” mode and test the part program at fixed speed.

Unit Content

End

SEQUENCE

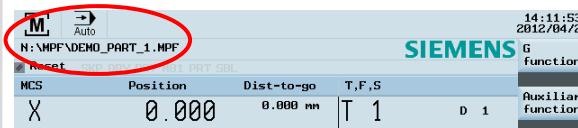

Before the part program can be loaded and executed in AUTO mode, it must be tested using the simulation function mentioned previously!

Press the “Execute” SK on the PPU.

Execute

The control is now in AUTO mode with the current opened program storage path being displayed and the AUTO lamp on the MCP is on.

Now the program is ready to start and the actual operation will be described in the next section!

SEQUENCE

Before executing the “Dry Run”, please change the offset value appropriately for the real workpiece size in order to avoid cutting the real workpiece during the dry run and avoid unnecessary danger!

Note: The following operation is based on the finished “program execution”

Step 1

The data in the “Dry run feedrate” must first be set and checked!

Press the “Offset” key on the PPU.

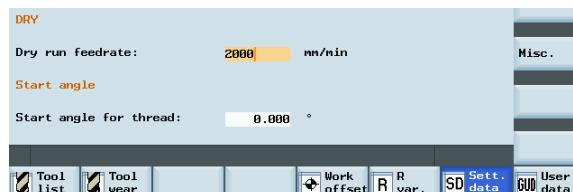

Press the “Sett. data” SK on the PPU.

Use the traversing key to move to the required position.
The position is now highlighted.

Enter the required feedrate in mm/min, enter “2000” in the example.

Press the “Input” key of the PPU.

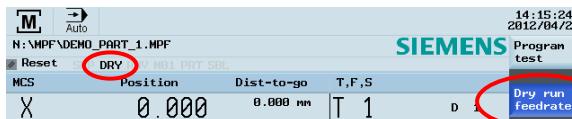

Press the “Machine” key on the PPU.

Press the “Prog. cont.” SK on the PPU.

Press the “Dry run feedrate” SK on the PPU.

Note: The “DRY” symbol is shown and the “Dry run feedrate” SK is highlighted in blue.

Press the “Back” SK on the PPU.

Step 2

Make sure the feedrate override on the MCP is 0%.

Press “Door” on the MCP to close the door of the machine. (If you don’t use this function, just close the door in the machine manually.)

Press “CYCLE START” on the MCP to execute the program.

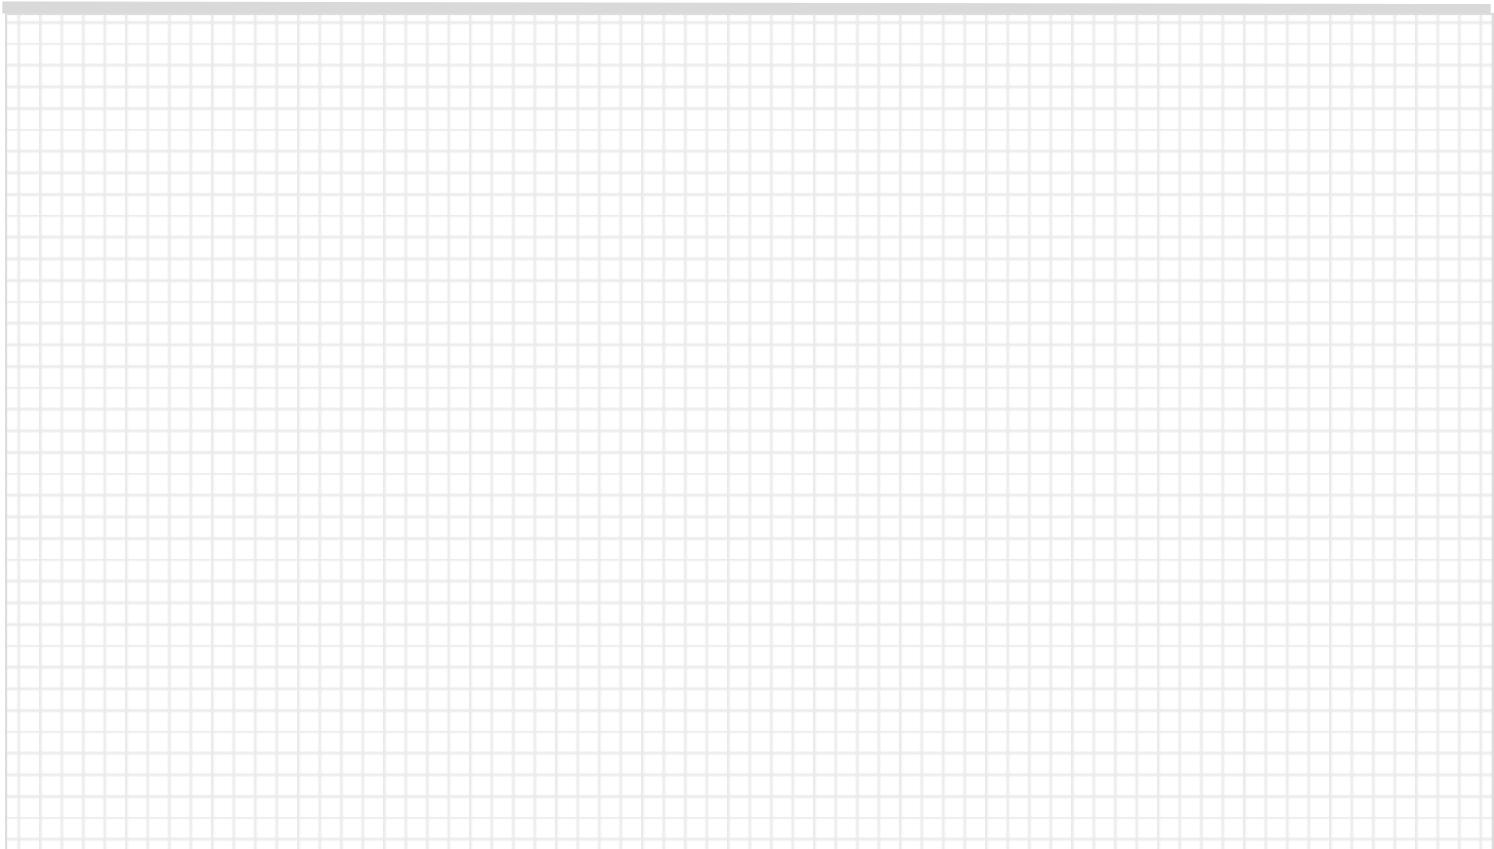

Turn the feedrate override gradually to the required value.

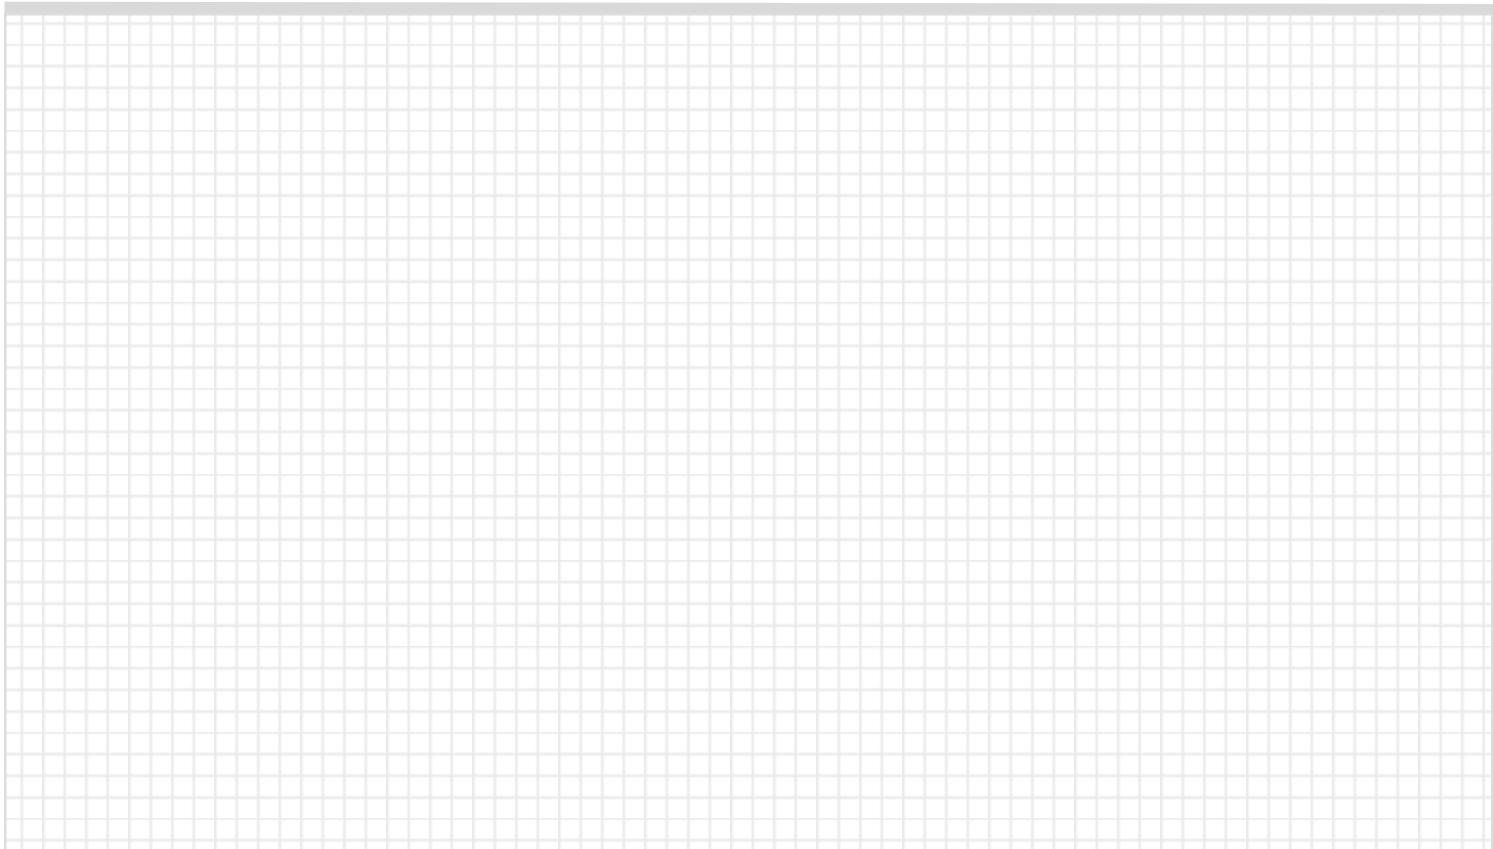

After finishing the dry run, please turn the changed offset back to the original value in order to avoid affecting the actual machining!

Make sure the program is correct before machining pieces!

Set the program in the ready-to-start status as shown on the left in accordance with the "Program execution" sequences.

Perform the relevant safety precautions!

Make sure that only "AUTO" mode and "ROV" mode are activated (or select the M01 function if required).

Notes: M01 function → program will stop at the position where there is M01 code.

Make sure that the feedrate override on the MCP is 0%!

Press "Door" on the MCP to close the door of the machine. (If you don't use this function, just close the door on the machine manually.)

Press "CYCLE START" on the MCP to execute the program.

Turn the feedrate override gradually to the required value.

Machine Pieces

SEQUENCE

Tool Wear

The tool wear compensation must distinguish the direction of compensation clearly!

Step 1

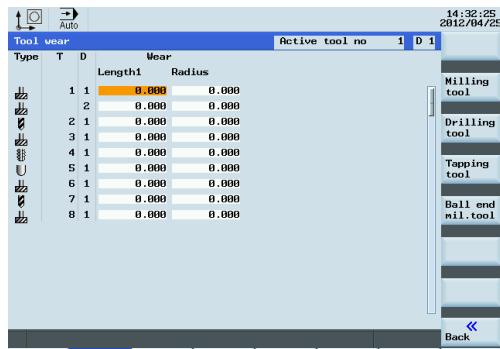

Press the "Offset" key on the PPU.

Press the "Tool wear" SK on the PPU.

Use the direction keys to select the required tools and their edges.

Step 2

Set the tool length wear parameter of axis X in "Length X", the sign determines the direction of wear compensation.

Set the tool length wear parameter of axis Z in "Length Z", the sign determines the direction of wear compensation.

Positive value: The tool moves away from the workpiece
Negative value: The tool moves closer to the workpiece

Press "Input" on the PPU to activate the compensation.

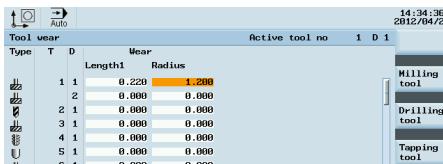

Set the tool radius wear parameter in "Radius", the sign determines the direction of wear compensation.

Positive value: tool is away from workpiece (set radius bigger than real one)

Negative value: tool is close to workpiece (set radius smaller than real one)

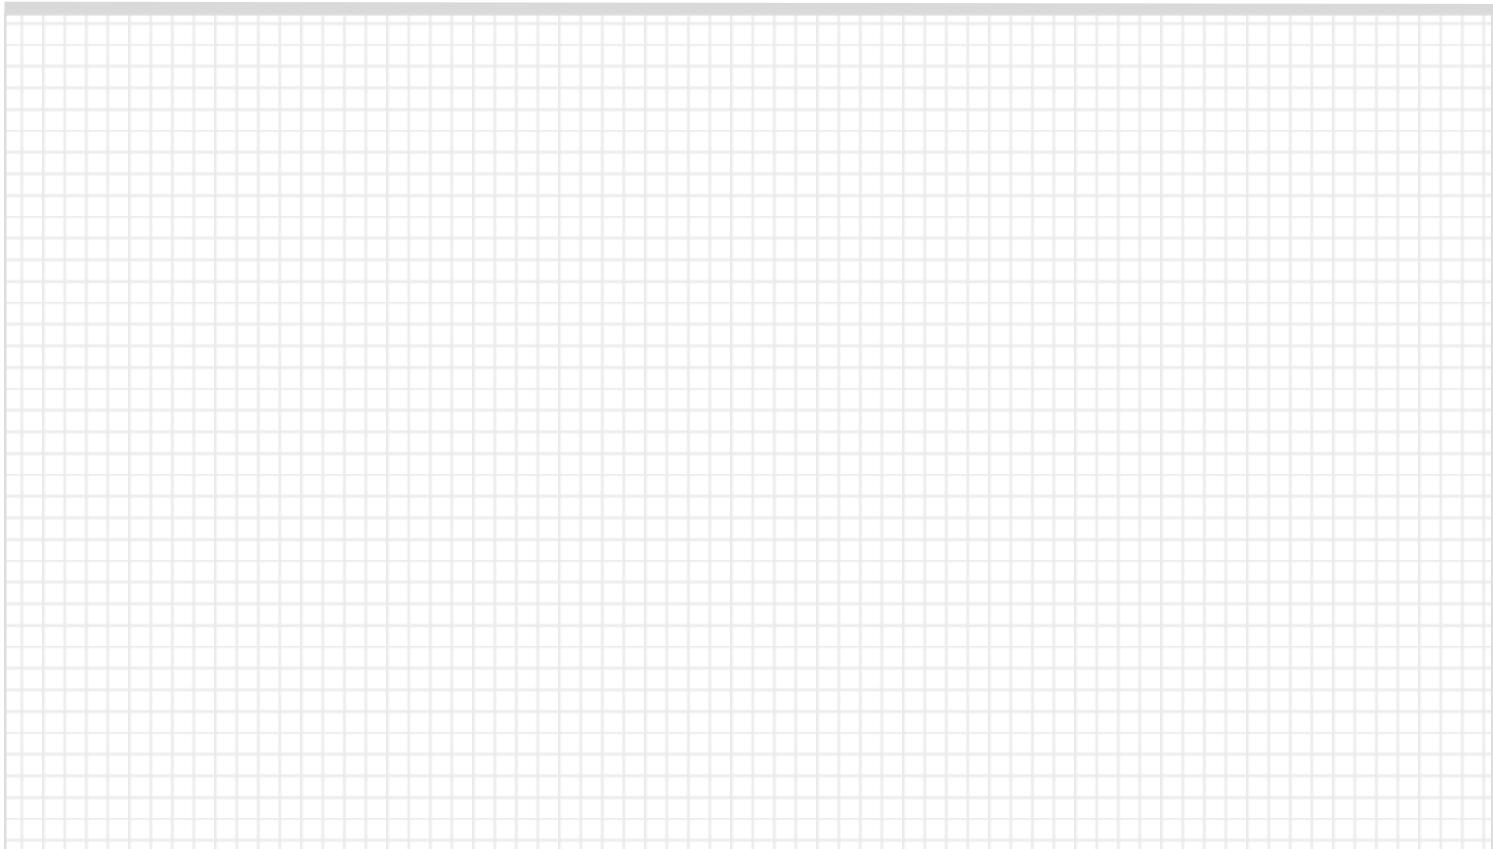

Press "Input" on the PPU to activate the compensation.

Compensation data have been activated!

SEQUENCE

“USB” is used to transfer the programs to and from the NC.

Step 4 Use the “Copy” and “Paste” SKs to transfer the part program from NC to USB.

Connect a USB device with sufficient memory to the USB interface on the PPU.

Press the “NC” SK on the PPU.

Use “Cursor + Select” to select the required part program. + The selected program will be highlighted.

Press the “Copy” SK on the PPU.

Press the “USB” SK on the PPU.

Press the “Paste” SK on the PPU.

Step 5 Use the “Copy” and “Paste” SKs to transfer the part program from USB to NC.

Connect the USB device with the stored target programs to the USB interface on the PPU.

Press the “USB” SK on the PPU.

Use “Cursor + Select” to select the required part program. + The selected program will be highlighted.

Press the “Copy” SK on the PPU.

Press the “NC” SK on the PPU.

Press the “Paste” SK on the PPU.

Additional Information Part 1

SIEMENS

SEQUENCE

A shared network drive can be made using an ethernet connection between the PC and the PPU so the transferring and backup of NC programs can be performed easier.

Step 1 Set PPU IP address.

Connect PC using a network cable to the rear X130 ethernet port on the PPU

Press key: +

Press key: >

Press "Serv. Dispil." SK

Press "Service control" SK

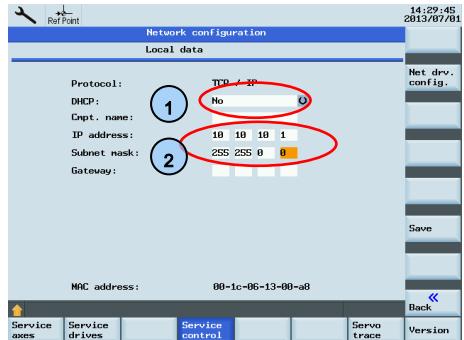

Press "Network Info" button to enter the "Local Configuration Data"

In the "local configuration data" in the relevant parameters.

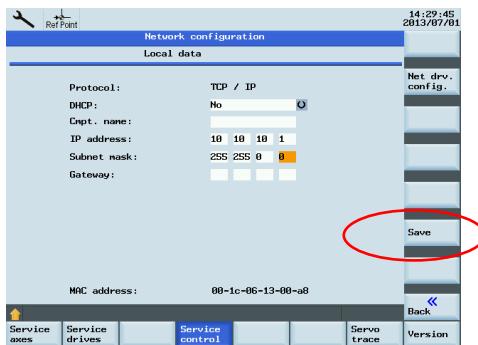

- ① DHCP is set to "No"
- ② IP address and subnet mask can be arbitrarily set according to need. (Right given only as an example)

"Local Configuration Data" setting finished, press the "Save" button to activate the data set.

Save

When the "data storage end" is displayed, the input data activation effect.

Additional Information Part 1

SIEMENS

SEQUENCE

Step 2 Set the PC's static IP address.

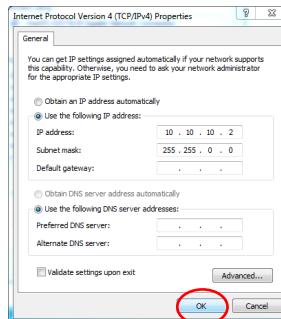

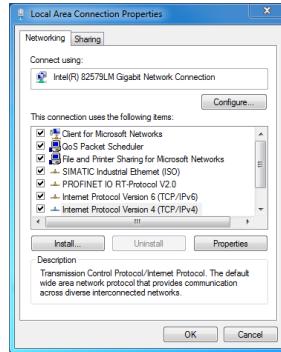

Ensure PC/PG is connected using a network cable to rear X130 PPU Ethernet port.

Open the PC's network connection settings, in the "local area connection properties" select "Internet Protocol (TCP / IP)" And double click "Properties".

In the dialog box, select "Use the following IP address" and fill in the required IP address.
(Shown right only given as an example)
Select "OK" to complete the setup.

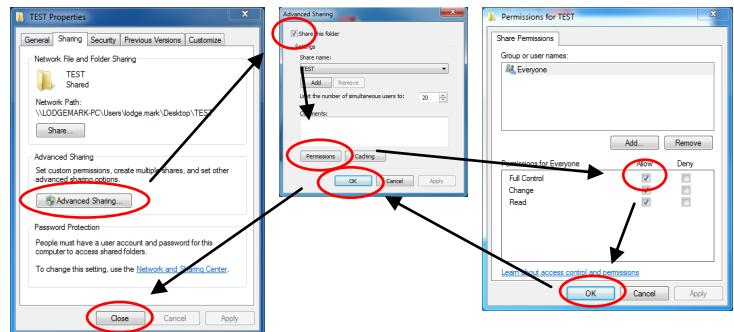

Note: The address "10.10.10.2" setting is based on the first step in the IP address of the PPU.

PPU and PC IP address should be kept in the same network segment.

Step 3 On PC create a shared folder.

Anywhere on your PC create a new folder with a simple name (do not use special characters). This example creates a folder named "Test". Once created, right-click the folder and select "Properties." then select the pull down menu "Sharing".

In the dialog window, select "Advanced Sharing"
Then check "Share this folder"
Then select "Permissions" and check "Full control".
Select "OK" - "OK" - "Close" to activate the settings.
In this folder you can put some machining program.

Step 4 Add the network drive on the PPU side to activate the shared folder, and online processing

Net. drv.
config.

In the "Network drive configuration" screen select "Net drv. Config."

Additional Information Part 1

SIEMENS

SEQUENCE

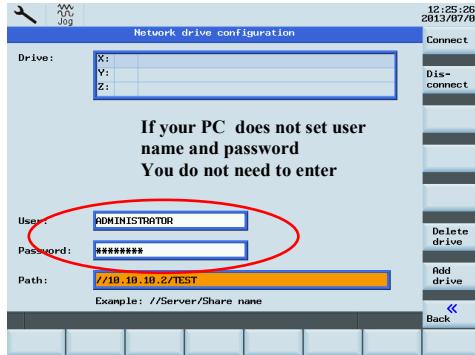

In the “Network Drive Configuration” Enter PC login user name, password, and path of where shared folder is. In accordance to the format required.

Server: IP address
Share Name: the name of the shared folder

Note: Use “TAB” key to switching between different tasks boxes.

Add drive Press “Add Drive” SK to add it to the specified drive letter

After set successful, the screen will displayed “Network drive added successfully” while the set path is automatically written to the “drive” Window.

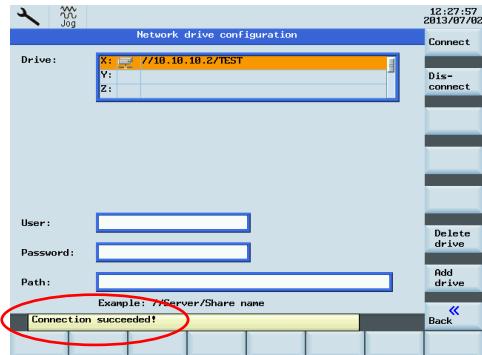

If the connection is lost select the drive path and press “Connect.” SK

Connect

This will re-establish the connection with PC/PG.

This will be shown with the text “Connection succeeded”

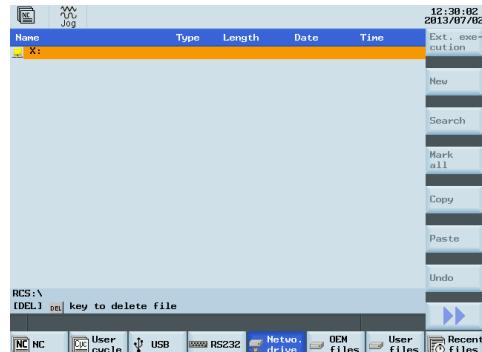

Press “Program Manager” Button

Press “netwo. Drive” SK to enter the network drive interface.

Press “Enter” Button to open network drive to PC/PG.

Additional Information Part 1

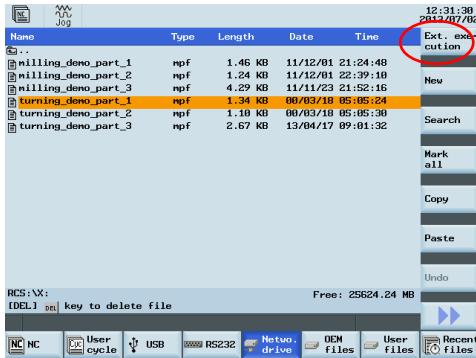

SIEMENS

SEQUENCE

You can now see the content of the shared folder with all the machining programs.

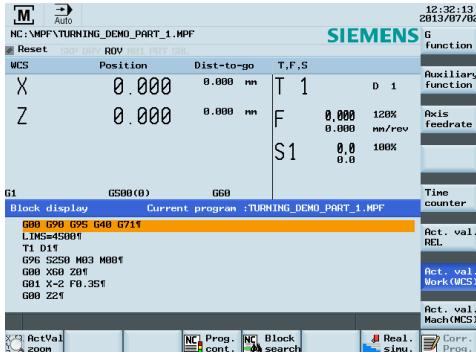

You can select the file you require to execute in AUTO mode, click "Exe. Execution".

Ext. exec-
ution

The system will automatically jump to AUTO mode, select the appropriate NC program.
Press the "Cycle Start" button for machining operation.

CYCLE
START

Note: You can also use the "Copy", "Paste" key to achieve "NC", "USB" and "Network Drive" moving files.

The PPU has an online help which shows the contents of standard documents.

Press the "Help" key on the PPU.

Press the "Cur. Topic" key on the PPU.

The help information related to the current topic will be shown on screen.

Press the "OEM Manual" key on the PPU.

The online help manual of the OEM will be shown on the screen.

Press the "TOC" key on the PPU.

The online help from the Siemens manual will be shown.

Additional Information Part 1

SIEMENS

SEQUENCE

Manual face cutting

"Face cutting" is used to cut the oversized materials on the rough face before starting to machine.

Step 1

Press the "Machine" key on the PPU.

Press the "JOG" key on the MCP.

Press the "Sett." SK on the PPU.

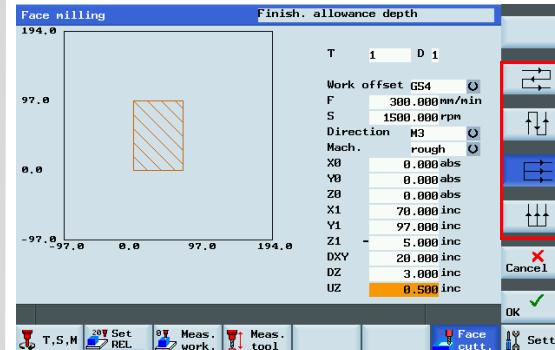

Enter appropriate values in "Retraction plane" and "Safety distance".

Press the "Input" key on the PPU to activate the settings.

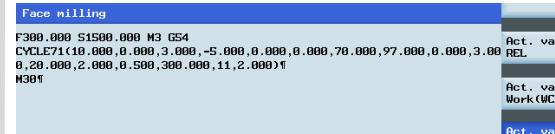

Step 2

Press "Face cutt." SK on PPU.

Enter appropriate data in the "Face Milling" window according to the machining requirement. Use the button on the right side of the PPU to select the cutting path of the tool during machining.

Press the "OK" SK on the PPU

The system now automatically creates the programs.

Make sure that the override value on the MCP is 0%!

Press the "Cycle Start" key on the MCP.

Adjust the override on the MCP gradually to the required values.

SEQUENCE

R parameters

The arithmetic parameters are used in a part program for value assignment, and also for some necessary value calculations. The required values can be set or calculated by the control system during program execution. Some of the common arithmetic functions are shown below:

Arithmetic parameters	Meaning
+	Addition
-	Subtraction
*	Multiplication
/	Division
=	Equals
Sin()	Sine
COS()	Cosine
TAN()	Tangent
ASIN()	Arcsine
ACOS()	Arccosine
ATAN2(,)	Arctangent2
SQRT()	Square root
ABS()	Absolute value

Note:

Reprocessing stop

Programming the STOPRE command in a block will stop block preprocessing and buffering. The following block is not executed until all preprocessed and saved blocks have been executed in full. The preceding block is stopped in exact stop (as with G9).

Below shows the connection between program and “R variables” status windows

Press the “Offset” key on the PPU.

Press the “R var.” SK on the PPU.

Time change

You can change the time on the control if required when the clocks changes from summer time to winter time.

Press "Shift" and "Alarm" on the PPU simultaneously.

Make sure the password is set to the "CUSTOMER" access level.

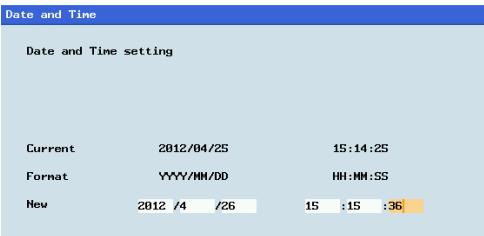

Press the "HMI" SK on the PPU.

Press the "Date time" SK on the PPU.

Enter a new "Date" and "Time".

Press the "OK" SK on the PPU.

Date and Time

Date and Time setting

Current	2012/04/25	15:14:25
Format	YYYY/MM/DD	HH:MM:SS
New	2012 /4 /26	15 :15 :36

Press the "Cancel" SK on the PPU to abort the operation.

Save data

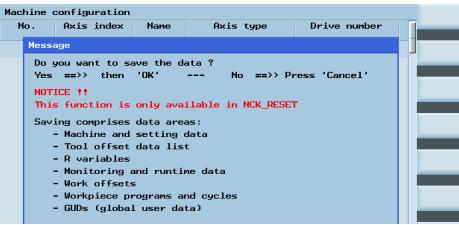

"Save data" enables the complete system to be backed up on the system CF card so that there is a system backup available to the operator.

Press "Shift" and "Alarm" on the PPU simultaneously.

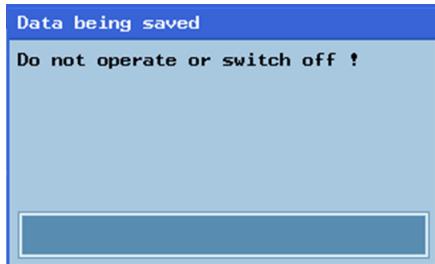

Make sure the password is set to the "CUSTOMER" access level.

Press the "Save data" SK on the PPU.

SEQUENCE

Press the "OK" SK on the PPU.

While the control is saving data to the system, do not operate or switch off the control!

When a machine has a manual gearbox on the spindle, it is the responsibility of the operator to change gear at the correct place in the part program.

If the machine tool manufacturer has fitted an automatic gearbox, the following M-codes can be used to change gear in the part program:

Gear stages M40, M41, M42, M43, M44 and M45 are available.

M40	Automatic gear selection
M41	Gear stage 1
M42	Gear stage 2
M43	Gear stage 3
M44	Gear stage 4
M45	Gear stage 5

Example:

The machine tool manufacturer specifies a speed range for each gear stage:

S0...500	Gear stage 1 → M41
S400..1200	Gear stage 2 → M42
S1000..2000	Gear stage 3 → M43

If the operator is manually selecting the gear stage in the part program, it is the operator's responsibility to select the correct gear stage according to the required speed.

M/H function

The M function initiates switching operations, such as "Coolant ON/OFF". Various M functions have already been assigned a fixed functionality by the CNC manufacturer. The M functions not yet assigned are reserved for free use of the machine tool manufacturer.

With H functions, the meaning of the values of a specific H function is defined by the machine tool manufacturer.

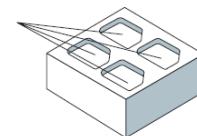

M codes and H functions created by the OEM should be backed up by the machine tool manufacturer.

Specified M function	Explanation	Specified M function	Explanation
M0	Stop program	M6	Tool change
M1	Stop program with conditions	M7 / M8	Coolant on
M2	End program	M9	Coolant off
M30	End program and back to the beginning	M40	Select gear stage automatically
M17	End subprogram	M41~M45	Change spindle gear
M3 / M4 / M5	Spindle CW/CCW/ Stop		

Subpro- gram

Frequently used machining sequences, e.g. certain contour shapes, are stored in subprograms. These subprograms are called at the appropriate locations in the main program and then executed.

Subprogram for positions of the four pockets.

Example

The structure of a subprogram is identical to that of the main program, but a subprogram contains M17 - end of program in the last block of the program sequence. This means a return to the program level where the subprogram was called.

The subprogram should be given a unique name enabling it to be selected from several subprograms. When you create the program, the program name may be freely selected.

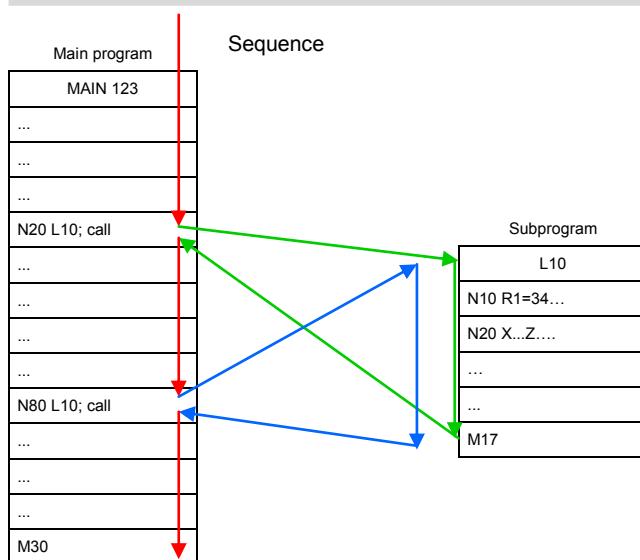

However, the following rule should be observed:

The name can contain letters, numbers and underscores and should be between 2 and 8 characters long.

Example: LRAHMEN7

SEQUENCE

Subprograms can be called from a main program, and also from another subprogram. In total, up to eight program levels, including the main program, are available for this type of nested call.

Polar coordinates

In addition to the common specification in Cartesian coordinates (X, Y, Z), the points of a workpiece can also be specified using polar coordinates. Polar coordinates are also helpful if a workpiece or a part of it is dimensioned from a central point (pole) with specification of the radius and the angle.

The polar coordinates refer to the plane activated with G17 to G19. In addition, the third axis perpendicular to this plane can be specified. When doing so, spatial specifications can be programmed as cylindrical coordinates.

The polar radius RP= specifies the distance of the point to the pole. It is saved and must only be written in blocks in which it changes, after the pole or the plane has been changed.

The polar angle AP= is always referred to the horizontal axis (abscissa) of the plane (for example, with G17: X axis). Positive or negative angle specifications are possible. The positive angle is defined as follows: Starting from the plus direction of X axis and rotates CCW.

It is saved and must only be written in blocks in which it changes, after the pole or the plane has been changed.

Basic Theory

G110 Pole specification relative to the setpoint position last programmed (in the plane, e.g. with G17: X/Y)

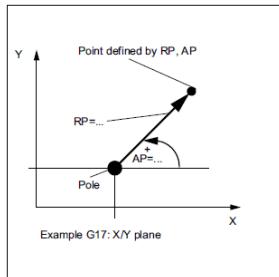

(when using G110, please always take the current position of the tool as the reference point to specify the new pole)

G111 Pole specification relative to the origin of the current workpiece coordinate system (in the plane, e.g. with G17: X/Y)

G112 Pole specification, relative to the last valid pole; retain plane

Programming example

```
N10 G17 ; X/Y plane
N20 G111 X17 Y36 ; pole coordinates in the current workpiece
AP=45 RP=50 coordinate system
...
N80 G112 X35.35 Y35.35 ; new pole, relative to the last pole as a
AP=45 RP=27.8 polar coordinate
N90 ... AP=12.5 RP=47.679 ; polar coordinate
N100 ... AP=26.3 RP=7.344 Z4 ; polar coordinate and Z axis (= cylinder
                                coordinate)
```

Additive workpiece offsets

The programmable workpiece offsets TRANS and ATRANS can be used in the following cases:

- For recurring shapes/arrangements in various positions on the workpiece
- When selecting a new reference point for dimensioning

This results in the current workpiece coordinate system.

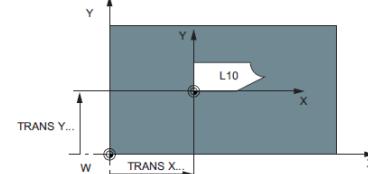

TRANS X...Y... Z... ; programmable offset (absolute)

ATRANS X...Y... Z... ; programmable offset, additive to existing offset
(incremental)

TRANS ; without values, clears old commands for offset

Programming example

N20 TRANS X20.0 Y15.0 programmable offset
L10 subprogram call

Basic Theory

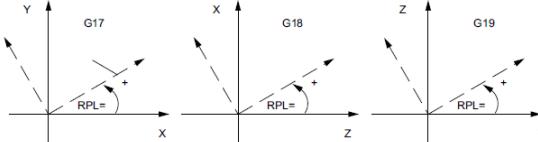

Coordinate rotation ROT AROT

The programmable rotation ROT, AROT can be used:

The rotation is performed in the current plane G17, G18 or G19 using the value of RPL=...specified in degrees.

ROT RPL=... ; programmable rotation offset (absolute).
AROT RPL=... ; programmable offset, additive to existing offset (incremental)
ROT ; without values, clears old commands for offset

N10 G17
N20 AROT RPL=45 additive 45 degree rotation
L10 subprogram call

Scaling

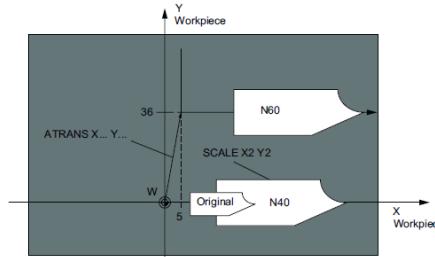

A scale factor can be programmed for all axes with SCALE, ASCALE. The path is enlarged or reduced by this factor in the specified axis. The currently set coordinate system is used as the reference for the scale change.

SCALE X...Y...Z... ; programmable rotation offset (absolute)
ASCALE X...Y...Z... ; programmable offset, additive to existing offset (incremental)

If a program contains SCALE or ASCALE, this must be programmed in a separate block.

Programming example

N10 G17
N20 SCALE X2.0 Y2.0 ; contour is enlarged two times in X and Y
L10 subprogram call

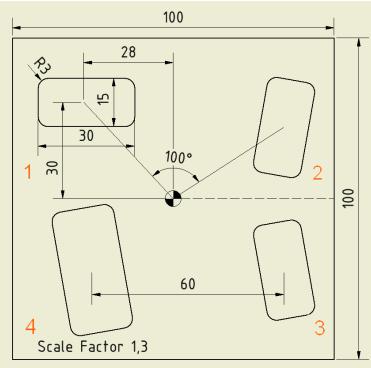

Basic Theory

Program example

This describes and analyzes the additive offset, coordinate rotation, scaling functions mentioned above.

Machining target dimension drawing and the final effect are as follows:

Drawing 1—original workpiece machining

Drawing 2—coordinate rotates 100°

Drawing 3—①Drawing 2 along X axis mirror image

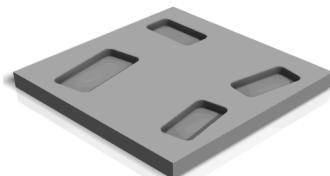

②Coordinate rotates 20°

Drawing 4—①Drawing 3 along Y axis moves 60 in negative direction

②enlarge 1.3 times in X and Y direction

In this example, the positive direction of the XY coordinate axis is different when machining each groove!

Basic Theory

Program
jump

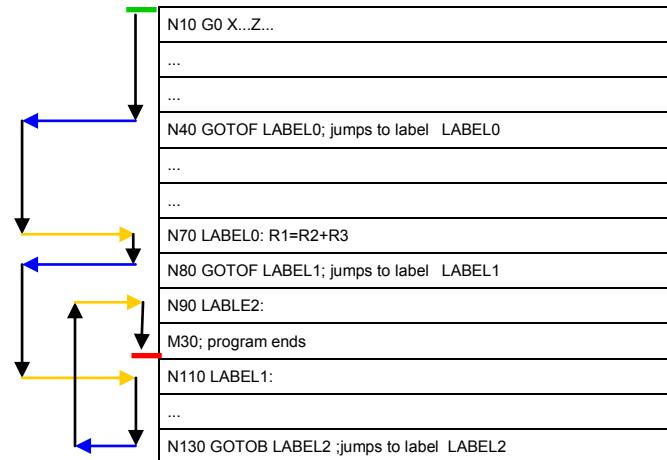

NC programs process their blocks in the sequence in which they were arranged when they were written. The processing sequence can be changed by introducing program jumps. The jump destination can be a block with a label or with a block number. This block must be located within the program. The unconditional jump command requires a separate block.

GOTOF+ label: Jump forward (in the direction of the end block of the program)

GOTOB+ label: Jump backward (in the direction of the start block of the program)

Label: Name of the selected string (standing for the required jump program block) or block number

Program execution

Unconditional jump example

Basic Theory

Program skip

Method 1

“;” code

Using “;” code at the beginning of the block can skip this string.
“;” can also be used to add remarks to the block.

See the figure on the right for an example of use.

N5 G17 G90 G500 G71

N10 T1 D1 M6
N15 S5000 M3 G94 F300
N20 G00 X50 Y50 Z5
N25 G01 Z-20
N30 Z5

...
N85 T2 D1 M6 **Tool change**
N90 S5000 M3 G94 F300
; N95 G00 X60 Y55 Z11
...

Using “;” code at the beginning of the program block N95, this string will be skipped without execution.

Using “;” code to add a remark to the N85 function, without any influence on the execution.

Method 2

Press the “Machine” key on the PPU.

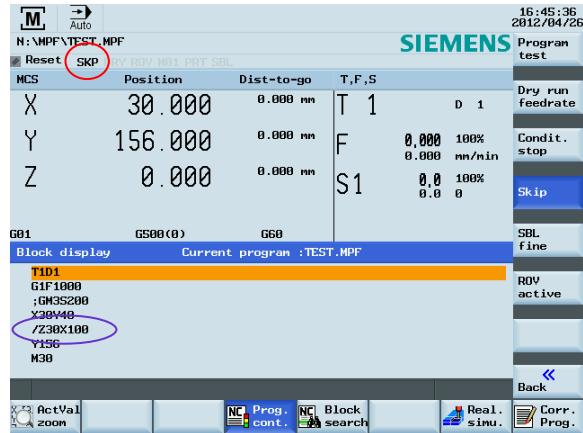

Press the “Auto” key on the MCP.

Press the “Prog cont.” SK on the PPU.

Press the “Skip” SK on the PPU.

When “SKP” is displayed (red circle), the skip function has been activated. After activating “SKP”, using “/” at the beginning of the program string (shown in purple circle), the string will be skipped without influencing the execution.

Basic Theory

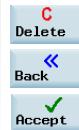

Calculator

You can use the calculator to calculate contour elements, values in the program editor, tool offsets and workpiece offsets and enter the results on the screen.

Press the “=” SK on the PPU.

SEQUENCE

Press this SK to delete the contents in the calculator.

Press this SK to exit the calculator screen.

Use this SK to accept the input and write the values to the required position.

If the input field is already occupied by a value, the calculator will take this value into the input line.

Use the “Accept” SK to enter the result in the input field at the current cursor position of the part program editor. The calculator will then close automatically.

Notes

A large rectangular area filled with a uniform grid of light gray lines, creating a pattern of small squares across the entire surface. This grid is intended for users to write their notes or draw diagrams.

Content

Unit Description

This unit shows three typical program examples of frequently used milling cycles and the corresponding machining diagrams with detailed explanations.

Unit Content

- Milling program 1
- Milling program 2
- Milling program 3

End

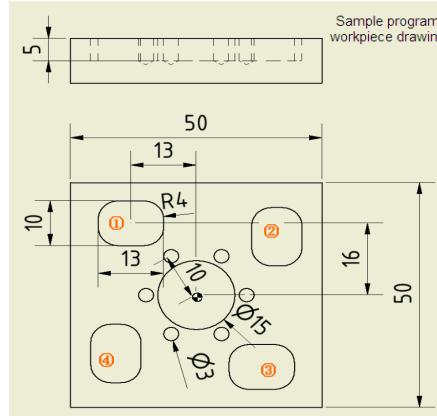

Note: All the program examples in this book are only for reference. If you want to perform actual operations, please adjust the tool offset, coordinate moving range, workpiece plane settings, etc. according to the actual machine conditions!

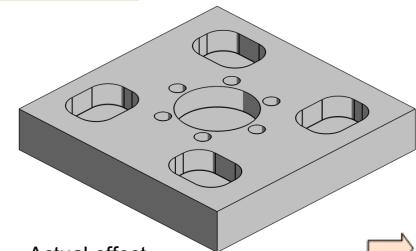

Drawing

Make sure all the preparations and safety measures have been performed before machining!

The zero point of the workpiece is located at the center point of the workpiece

Unit Description

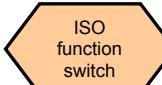

This unit describes the ISO operating functions in 808D ADVANCED, compares the similarities and differences of the machining code in DIN mode and ISO mode and shows how to transfer and implement the ISO machining program. The examples in ISO mode chapter can be run in 808D ADVANCED ISO mode.

Unit Content

End

Basic Theory

Siemens standard machining codes are implemented in DIN mode. The 808D ADVANCED also provides appropriate functions for implementing the ISO commands, but the ISO mode must be activated during operation.

ISO function switch

Method 1

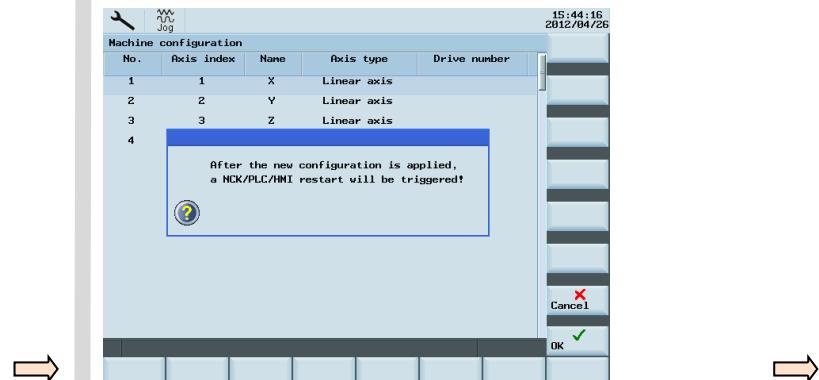

Press the “Shift” + “System - Alarm” keys on the PPU. Input the manufacturer’s password (“SUNRISE”)

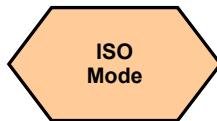

Press the “ISO mode” SK on the right.

A dialog box appears prompting whether to activate the new setting. Select the “OK” SK to activate it.

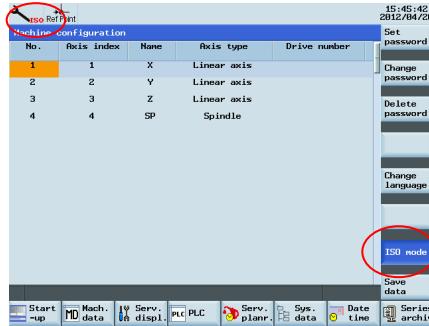

Basic Theory

After pressing "OK", the system restarts automatically.

After restarting, press "Shift" + "System - Alarm" again and if the symbol in the red circle appears, ISO mode is already activated.

A red ISO appears at the top of the screen and the ISO mode button on the right is highlighted in blue.

Method 2

When using method 2 to activate the ISO mode, it will exit ISO mode and return to the default DIN mode via "Reset" button or after finishing the machining program.

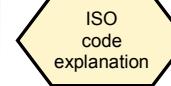

Insert G291 in the first line of the ISO part program to be executed and insert G290 in front of M30.

```
N0 G291
N5 G17 G90 G54 G71 11
N28 T1 H11
N25 H5G("Tool No. 1 in use")
N35G54R00 H31
N40 CYCLE71C 50.00000, 2.00000, 2.00000, 0.00000, 0.00000, 0.00000
N45 S4500 H31
```

G291/G290 commands must be set separately in a line!

If ISO is displayed at the top of the screen, it is activated.

All the ISO codes described in this unit can be implemented in the ISO mode of the 808D ADVANCED system!

Brief description of typical, frequently used ISO codes

ISO code	Description	Compare with DIN
G00	Orientation (rapid traverse)	As DIN
G1	Linear difference	As DIN
G17/G18/G19	XY plane / ZX plane / YZ plane	As DIN
G20/G21	Input in inch/mm	G70/G71
G41/G42/G40	Left tool tip radius compensation / right tool tip radius compensation / cancel tool radius compensation	As DIN
G54 ~ G59	Select workpiece coordinate system	As DIN
G80	Cancel fixed cycle	
G90/G91	Absolute/incremental programming	
G94/G95	Feedrate F in mm/min / mm/r	As DIN
S	Spindle speed	As DIN
, R	Reverse circle (note the form there must be ", " before R parameter)	RND
M3/M4/M5	Spindle right / spindle left / spindle stop	As DIN
M98 P _L_	Subprogram call (P+ subprogram name/ L+ times)	Program name + L
M99	End of Subroutine	M17

Basic Theory

In DIN mode, the tool length is activated automatically, but in ISO mode, you must activate the tool length via G code.

G43/G44 and G49

Use G43/G44, the tool length compensation value will be activated.

G43: Tool length compensation in positive direction

G44: Tool length compensation in negative direction

G49: Cancel tool length compensation

H01→Offset value 20.0
H02→Offset value -30.0
H03→Offset value 30.0
H04→Offset value -20.0

G90 G43 Z100.0 H01; Z will reach 120.0
G90 G43 Z100.0 H02; Z will reach 70.0
G90 G44 Z100.0 H03; Z will reach 70.0
G90 G44 Z100.0 H04; Z will reach 120.0

Note: In DIN mode, you must open the H code list in the tool list. For information on the opening method, please refer to the instructions for H code on [page 104](#)

G98 : Fixed cycle back to the original point

G99 : Fixed cycle back to R point

G80 : Cancel the fixed cycle

Pausing function **G04**

G04 X5.0→delay 5 s

G04 P5→delay 5 ms

N5 G90 T1 M06

N10 M3 S2000; spindle rotation
N20 G99 G81 X300 Y-250 Z-150

R-10 F120; after orientation drilling, back to R point

N30 X1000. ; after orientation drilling, back to R point

N40 G04 X2.0 ; delay 2 s

N50 G98 Y-550 ; after orientation drilling, back to start point

N60 G80 ; cancel the fixed cycle

N70 M5 ; spindle rotation stop

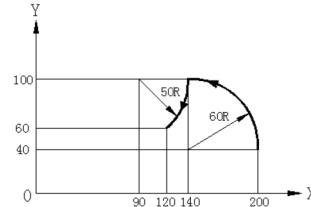

N80 M30

Code **G02** and **G03**

G02 circular interpolation in positive direction

G03 circular interpolation in negative direction

You can specify the circle end point in the following X/Z address for both. You can also describe circle radii with I, J, K incremental or use parameter R to specify radii directly.

Method 1 (use incremental to describe circular radius)

G92 X200.0 Y40.0 Z0
G90 G03 X140.0 Y100.0 I-60.0 F300.0
G02 X120.0 Y60.0 I-50.0

Method 2 (use parameter R to describe circular radius)

G92 X200.0 Y40.0 Z0
G90 G03 X140.0 Y100.0 R60.0 F300
G02 X120.0 Y60.0 R50.0

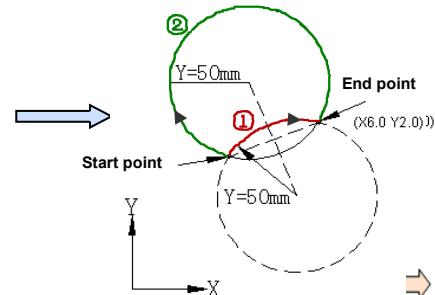

When specifying circle radii with parameter R

Circles less than 180° are assigned positive values

①→G02 X6.0 Y2.0 R50.0

Circles greater than 180° are assigned negative values

②→G02 X6.0 Y2.0 R-50.0

Basic Theory

Frequently used letter meanings of typical fixed cycle codes in ISO mode

P.	Descriptions	Unit	Applied range and note
X/Y	Cutting end point X/Z absolute coordinate values		G73 / G74 / G76 G81 ~ G87 / G89
Z	The distance incremental value between R point and the bottom of the hole, or the absolute coordinate value of the bottom of the hole		G73 / G74 / G76 G81 ~ G87 / G89
R	The distance incremental value between the start point plane and R point or the absolute coordinate value of R point		G73 / G74 / G76 G81 ~ G87 / G89
Q	The depth of every cut (incremental value)		G73 / G83
	Offset value (incremental value)		G76 / G87
P	The delay time at the bottom of the hole	ms	G74 / G76 / G89 G81 ~ G87
F	The feedrate of the cutting	mm/min	G73 / G74 / G76 G81 ~ G87 / G89
K	The repeat times of the fixed cycle		G73 / G74 / G76 G81 ~ G87 / G89

In 808D ADVANCED, the default ISO program feed distance unit is mm! (X100→100mm)

Note: change the parameter 10884=0, to make X100 → 100 um / X100. → 100 mm

Brief introduction of typical fixed cycle codes in ISO mode

For the meaning of letters when programming typical fixed cycles, please refer the figure on the left!

G73 fast-speed deep hole drilling

Common programming structures:

G73 X—Y—Z—R—Q—F—K

Motion process:

- ① Drilling motion (-Z) → intermediate feed
- ② Motion at the bottom of the hole → none
- ③ Retraction motion (+Z) → fast feed

G73 application example program:

M3 S1500 ; spindle rotation
G90 G99 G73 X0 Y0 Z-15 R-10 Q5 F120

; after orientation drill 1st hole, back to R point
Y-50 ; after orientation drill 2nd hole, back to R point
Y-80 ; after orientation drill 3rd hole, back to R point

X10 ; after orientation drill 4th hole, back to R point
Y10 ; after orientation drill 5th hole, back to R point

G98 Y75 ; after orientation drill 6th hole, back to R point
G80 ; cancel fixed cycle

G28 G91 X0 Y0 Z0 ; back to reference point

M5 ; spindle rotation stop
M30

G74 reverse tapping cycle

Common programming structures:

G74 X—Y—Z—R—P—F—K

Motion process:

- ① Drilling motion (-Z) → cutting feed
- ② Motion at the bottom of the hole → spindle rotation in positive direction
- ③ Retraction motion (+Z) → cutting feed

G74 application example program:

M4 S100 ; spindle rotation

G90 G99 G74 X300 Y-250 Z-150 R-120 P300 F120

; after orientation drill 1st hole, back to R point
Y-550 ; after orientation drill 2nd hole, back to R point
Y-750 ; after orientation drill 3rd hole, back to R point

X1000 ; after orientation drill 4th hole, back to R point
Y-550 ; after orientation drill 5th hole, back to R point

G98 Y750 ; after orientation drill 6th hole, back to R point
G80 ; cancel fixed cycle

G28 G91 X0 Y0 Z0 ; back to reference point

M5 ; spindle rotation stop
M30

Basic Theory**G76 Boring cycle**

Common programming structures:

G76 X—Y—Z—R—Q—P—F—K

Motion process:

- ① Drilling motion (-Z) → cutting feed
- ② Motion at the bottom of the hole → spindle stop directional
- ③ Retraction motion (+Z) → fast feed

G76 application example program:

```
M3 S500 ;spindle rotation
G90 G99
G76 X300 Y-250 Z-150 R-100 Q5 P1000 F120
;after orientation bore 1st hole, then move 5 mm,
stop for 1 s at the bottom of the hole, back to the R
point.
Y-50 ;bore 2nd hole (the same as 1st hole )
Y-80 ;bore 3rd hole (the same as 1st hole)
X10 ;bore 4th hole (the same as 1st hole)
Y10 ;bore 5th hole (the same as 1st hole)
G98 Y-750 ;bore 6th hole, then move 5 mm,
stop for 1 s at the bottom of the hole, back to the start
point position plane
G80 ;cancel fixed cycle
G28 G91 X0 Y0 Z0 ;back to reference point
M5 ;spindle rotation stop
M30
```

G81 Drilling cycle (fixed point drilling)

Common programming structures:

G81 X—Y—Z—R—F—K

Motion process:

- ① Drilling motion (-Z) → cutting feed
- ② Motion at the bottom of the hole → none
- ③ Retraction motion (+Z) → fast feed

G81 application example program:

```
M3 S2000 ;spindle rotation
G90 G99 G81 X300 Y-250 Z-150 R-10 F120
;after orientation drill 1st hole, back to R point
Y-550 ;after orientation drill 2nd hole, back to R
point
Y-750 ;after orientation drill 3rd hole, back to R
point
X1000 ;after orientation drill 4th hole, back to R
point
Y-550 ;after orientation drill 5th hole, back to R
point
G98 Y-750 ;after orientation drill 6th hole, back to
start plane
G80 ;cancel fixed cycle
G28 G91 X0 Y0 Z0 ;back to reference point
M5 ;spindle rotation stop
M30
```

G82 Drilling cycle (countersink drilling)

Common programming structures:

G82 X—Y—Z—R—P—F—K

Motion process:

- ① Drilling motion (-Z) → cutting feed
- ② Motion at the bottom of the hole → pause
- ③ Retraction motion (+Z) → fast feed

G82 application example program:

```
M3 S2000 ;spindle rotation
G90 G99 G82 X300 Y-250 Z-150 R-100 P1000 F120
;after orientation drill 1st hole, stop for 1 s at the bottom
of the hole, back to the R point.
Y-550 ;drill 2nd hole (the same as 1st hole)
Y-750 ;drill 3rd hole (the same as 1st hole)
X1000 ;drill 4th hole (the same as 1st hole)
Y-550 ;drill 5th hole (the same as 1st hole)
G98 Y-750 ;drill 6th hole, stop for 1 s at the
bottom of the hole, back to the start point position plane
G80 ;cancel fixed cycle
G28 G91 X0 Y0 Z0 ;back to reference point
M5 ;spindle rotation stop
M30
```

G83 Drilling cycle (deep hole drilling)

Common programming structures:

G83 X—Y—Z—R—Q—F—K

Motion process:

- ① Drilling motion (-Z) → intermission feed
- ② Motion at the bottom of the hole → None
- ③ Retraction motion (+Z) → fast feed

G83 application example program:

```
M3 S2000 ;spindle rotation
G90 G99 G83 X300 Y-250 Z-150 R-100 Q15 F120
;after orientation drill 1st hole, back to R point
Y-550 ;after orientation drill 2nd hole, back to R point
Y-750 ;after orientation drill 3rd hole, back to R point
X1000 ;after orientation drill 4th hole, back to R point
Y-550 ;after orientation drill 5th hole, back to R point
G98 Y-750 ;after orientation drill 6th hole, back to start
plane
G80 ;cancel fixed cycle
G28 G91 X0 Y0 Z0 ;back to reference point
M5 ;spindle rotation stop
M30
```

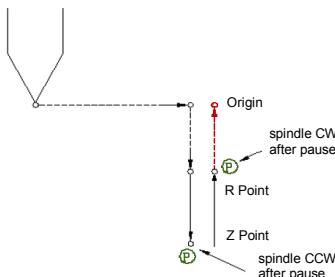

Basic Theory**G84 Tapping cycle**

Common programming structures:

G84 X—Y—Z—R—P—F—K

Motion process:

- ① Drilling motion (-Z) → cutting feed
- ② Motion at the bottom of the hole → spindle rotation in negative direction
- ③ Retraction motion (+Z) → cutting feed

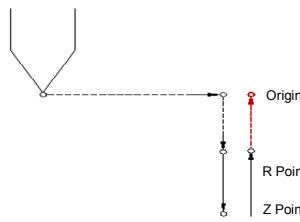

G84 execution operation graphic:With command G99 without operation in red line
With command G98 with operation in red line**G85 boring cycle**

Common programming structures:

G85 X—Y—Z—R—F—K

Motion process:

- ① Drilling motion (-Z) → cutting feed
- ② Motion at the bottom of the hole → none
- ③ Retraction motion (+Z) → cutting feed

G85 execution operation graphic:With command G99 without operation in red line
With command G98 with operation in red line
Except that the spindle is not rotating at the bottom of the hole, **G85** is same as **G84****G86 boring cycle**

Common programming structures:

G86 X—Y—Z—R—F—K

Motion process:

- ① Drilling motion (-Z) → cutting feed
- ② Motion at the bottom of the hole → spindle stop
- ③ Retraction motion (+Z) → fast feed

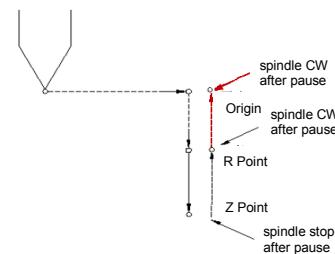

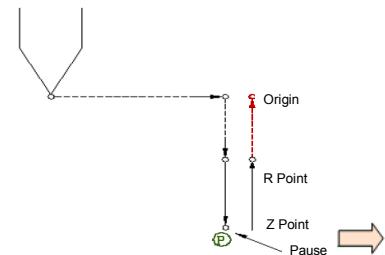

G88 boring cycle

Common programming structures:

G88 X—Y—Z—R—P—F—L

Motion process:

- ① Drilling motion (-Z) → cutting feed
- ② Motion at the bottom of the hole → pause
- ③ Retraction motion (+Z) → cutting feed

G86 execution operation graphic:With command G99 without operation in red line
With command G98 with operation in red line
Except for the stop at the bottom of the hole, **G86** is same as **G81****G88 execution operation graphic:**With command G99 without operation in red line

Fixed cycle II →

G87 execution operation graphic:

Fixed cycle I

ISO program transfer and operation

The ISO mode function provided by the 808D ADVANCED can easily operate the existing ISO program!

Step 1 Transfer ISO files in USB device to 808D.

Connect the USB device with the stored target programs to the USB interface on the PPU.

Press the "USB" SK on the PPU.

Use the "Cursor + Select" keys to select the required program which is then highlighted.

Press the "Copy" SK on the PPU.

Press the "NC" SK on the PPU.

Press the "Paste" SK on the PPU.

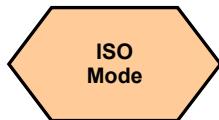

A specified ISO program is then stored in the 808D system and can be edited and executed as described above.

Step 2 Make the necessary changes to the ISO programs.

Programs in ISO mode in the 808D ADVANCED have their own rules. Suitable changes must be made at the appropriate positions so that you can run the ISO programs!

Basic Theory

Beginning of the program

Common ISO program:

Beginning is "O"

ISO mode of 808D:

Not compatible with the programs beginning with "O"

Common ISO program				808D ISO program			
O0001;				O0001; Delete this line			
G0 X50 Y50 Z50 M5				G0 X50 Y50 Z50 M5			
G04 X5				G04 X5			
M3 S1000				M3 S1000			
...				...			

Type	T	D	H	Length	Radius	Geometry	Active tool no	1
1	1	0	0	435.000	5.000			
2	1	0	0	500.000	6.000			
3	1	0	0	50.000	5.000			
4	1	0	0	87.000	8.000			
8	1	0	0	5.000	0.000			
10	1	0	0	0.000	0.000			

H code

In 808D standard DIN mode, you must open the H list in the tool list first and fill in the data accordingly

2 common methods

- ① Direct use of the ISO switch button on the PPU to enter ISO mode.
(We recommend the 1st method!)
- ② Enter code G291 in MDA mode and execute. When the "Reset" is not used, the H list in the tool list is open.

Note: Every tool only can use the H value corresponding to the edge.
In the graphic above, T2 H1 cannot be executed.

Step 3 Program execution

Make sure the current system is in ISO mode!
Make sure all preparations and safety measures have been performed!

Operate as described above.

Tool and workpiece setup → simulation → test → machining.

Step 4 Transfer the ISO files in the 808D to the USB device.

Connect the USB device with sufficient memory to the USB interface on the PPU.

Press the "NC" SK on the PPU.

Use the "Cursor + Select" keys to select the required program which is then highlighted.

Press the "Copy" SK on the PPU.

Press the "USB" SK on the PPU.

Press the "Paste" SK on the PPU.

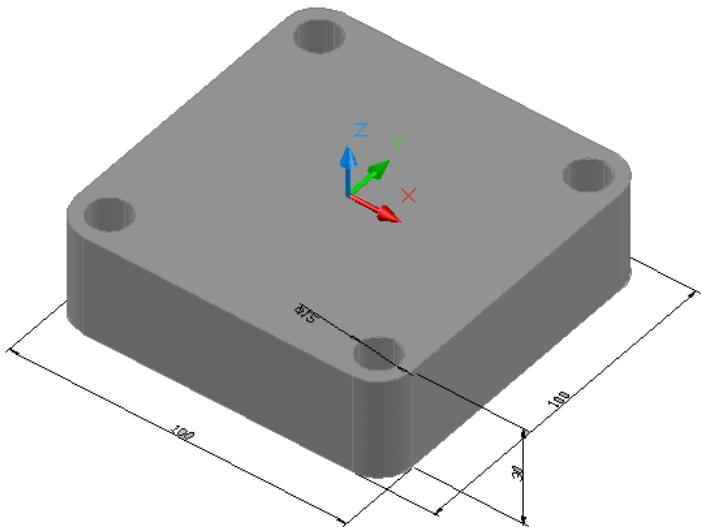

A specified ISO program is then stored in the USB and can be executed as required.

Basic Theory

Step 5 Sample program

Make sure the current system is in ISO mode!
Make sure all preparations and safety measures have been performed!

ISO programs can be executed in the 808D as follows:

N10 G291	N210 T2M6
N20 T1M6	N220 M3S3000F100
N30 G0G54G90G40	N230 G43H2Z50
N40 M3S1200F200	N240 G0X40Y-40
N50 G43H1Z50	N250 Z20
N60 G0X0Y-70	N260 G81Z-2R10
N70 Z5M8	N270 Y40
N80 G1Z-5	N290 X-40
N90 G01G41X20D1	N300 Y-40
N100 G03X0Y-50R20	N310 G80
N120 G1X-50,R10	N320 G0Z50
N130 Y50,R10	
N140 X50,R10	N330 T3M6
N150 Y-50,R10	N340 M3S3000F100
N160 X40	N350 G43H3Z50
N170 X0	N360 G73Z-20R10Q5
N180 G03X-20Y-70R20	N370 Y40
N190 G1G40X0	N380 Y-40
N200 G0Z50	N390 X40
	N400 Y40
	N410 G80
	N420 G0G40G90G49Z100
	N430 M09
	N440 G290
	N450 M30

Note: This program opens/exits ISO mode with the G291/G290 command. It is recommended to use the first method to open ISO mode — using the ISO mode active button on the PPU (described above)

**G
Functions****Group 1: Modally valid motion commands**

Name	Meaning
G00	Rapid traverse
G01 *	Linear interpolation
G02	Circular interpolation clockwise
G03	Circular interpolation counter-clockwise
CIP	Circular interpolation through intermediate point
CT	Circular interpolation; tangential transition
G33	Thread cutting with constant lead
G331	Thread interpolation
G332	Thread interpolation - retraction

Group 2: Non-modally valid motion, dwell

Name	Meaning
G04	Dwell time preset
G63	Tapping without synchronization
G74	Reference point approach with synchronization
G75	Fixed point approach
G147	SAR - Approach with a straight line
G148	SAR - Retract with a straight line
G247	SAR - Approach with a quadrant
G248	SAR - Retract with a quadrant
G347	SAR - Approach with a semicircle
G348	SAR - Retract with a semicircle

Group 3: Programmable frame

Name	Meaning
TRANS	Translation
ROT	Rotation
SCALE	Programmable scaling factor
MIRROR	Programmable mirroring
ATRANS	Additive translation
AROT	Additive programmable rotation
ASCALE	Additive programmable scaling factor
AMIRROR	Additive programmable mirroring
G110	Pole specification relative to the last programmed setpoint position
G111	Pole specification relative to origin of current workpiece coordinate system
G112	Pole specification relative to the last valid POLE

Group 6: Plane selection

Name	Meaning
G17 *	X/Y plane
G18	Z/X plane
G19	Y/Z plane

Group 7: Tool radius compensation

Name	Meaning
G40 *	Tool radius compensation OFF
G41	Tool radius compensation left of contour
G42	Tool radius compensation right of contour

Group 8: Settable zero offset

Name	Meaning
G500 *	Settable work offset OFF
G54	1st settable zero offset
G55	2nd settable zero offset
G56	3rd settable zero offset
G57	4th settable zero offset
G58	5th settable zero offset
G59	6th settable zero offset

Group 9: Frame suppression

Name	Meaning
G53	Non-modal skipping of the settable work offset
G153	Non-modal skipping of the settable work offset including base frame

Group 10: Exact stop — continuous — path mode

Name	Meaning
G60 *	Exact positioning
G64	Continuous — path mode

Group 11: Exact stop, non-modal

Name	Meaning
G09	Non-modal exact stop

Group 12: Exact stop window modally effective

Name	Meaning
G601 *	Exact stop window
G602	Exact stop window, coarse, with G60, G9

Group 13: Workpiece measuring inch/metric

Name	Meaning
G70	Inch dimension data input
G71 *	Metric dimension data input
G700	Inch dimension data input; also for feedrate F
G710	Metric dimension data input; also for feedrate F

Group 14: Absolute/Incremental dimension modally effective

Name	Meaning
G90 *	Absolute dimensions data input
G91	Incremental dimension data input

Group 15: Feedrate / Spindle modally effective

Name	Meaning
G94	Feedrate mm/min
G95	Feedrate F in mm/spindle revolutions

Group 16: Feedrate override modally effective

Name	Meaning
CFC *	Feedrate override with circle ON
CFTCP	Feedrate override OFF

Group 18: Behavior at corner when working with tool radius compensation

Name	Meaning
G450 *	Transition circle
G451	Point intersection

Group 44: Path segmentation with SAR modally effective

Name	Meaning
G340 *	Approach and retraction in space (SAR)
G341	Approach and retraction in the plane (SAR)

Group 47: External NC languages modally effective

Name	Meaning
G290 *	Siemens mode
G291	External mode

Transformations

Name	Meaning
TRACYL	Cylinder. Peripheral surface transformation
TRANSMIT	Transmit: Polar transformation
TRAFOOF	Deactivate transformation
